Invention is one of the great marks of genius.

Sir S. Reynolds.

Invention, strictly speaking, is little more than a new combination of those images which have been previously gathered and deposited in the memory. Nothing can be made of nothing; he who has laid up no materials can produce no combinations.

Sir S. Reynolds.

—Invention, Discovery. Invention differs.

up to materials can produce no combinances.

—Invention, Discovery. Invention differs from discovery: it is applied to the contrivance and production of something that did not before exist, while discovery brings to light what existed before, but which was not known. We are indebted to invention for the thermometer and barometer; to discovery for the knowledge of the islands in the Pacific Ocean, and for the knowledge of many metals and minerals not formerly known.—Invention, Inagination. Invention more properly signifies the power of combining the details of everyday life, or details already familiar, into a probable and consistent whole, akin to what we are accustomed to see or hear; imagination is the higher power of combining elements into new, consistent, and elevated creations. Invention gives us a picture pleasing from its probability and the accuracy of its details; imagination creates for us a new world, undreamed of before. The works of Defoe and of many of our tale-writers and novelists display invention, while those of Shaksper or Milton exemplify the power of in-

agination. — SYN. Contrivance, device, fabrication, excogitation.

One of the two great divisions of the animal kingdom—the other being the Vertebrata—including all animals destitute of vertebrae or a backbone. It comprises five of the six sub-kingdoms into which animals have been divided in accordance with their primary plans of structure or morphological types; viz., the Protozoa, Coelenterata, Annuloida, Annulosa, and Mollusca. See extract.

The Invertebrata, comprising the Protozoa, Celenterata, Annuloida, Annulosa, and Mollusca, are collectively distinguished by the following prims amongst others: the body if divided transversely, or cut in two, shows only a single tube containing all the vital organs. These organs, in the higher Invertebrata, consist of an alimentary or digestive cavity, a circulatory or 'hamal' system, and nervous or 'neural' system. The side of the body on which the 'hamal' or blood-vascular system is placed is called the 'hemal aspect,' whilst the side of the body on which the 'hamal' as him masses of the nervous system are situated is called the 'neural aspect.' When there is any skeleton, this is external (forming an 'cxo-skeleton'), and it is really nothing more than a hardening of the skim. The limbs, when present, are turned towards the neural aspect of the body.

Iodate (Tod-āt), n. [See Iodine.] Any compound of iodic acid with a base. The lodates form deflagrating mixtures with combustible matters, and on being heated to low redness oxygen gas is disengaged, and a metallic iodide remains. None of them have been found native. They are all of very sparing solubility, excepting the iodates of the alkalies. See Iodic.

Iodic (1-od'ik), a. Containing iodine; as, iodic silver. — Iodic acid (H IO₂), an acid formed by the action of oxidizing agents on iodine in presence of water or alkalies. Iodic acid is a white semi-transparent solid substance, which is inodorous, but has an astringent sour taste. It is very soluble in water, and detonates when heated with charcoal, sugar, and sulphur. Deoxidizing agents reduce it partly to hydriodic acid, which then reacts upon the remaining iodic acid, which are termed iodates, and these, like the chlorates, yield oxygen when heated, and an iodide remains.

Iodide (Tod-Id), n. A binary compound of iodine, with elements more electro-positive than itself, thus, todide of sodium, &c.

Iodine (Tod-In), n. [Gr. iodes, resembling a violet—ion, a violet, and eldor, resemblance.] Sym. I. At. wt. 127. In chem. a peculiar non-metallic elementary solid substance, constituting one of the group of halogens. It exists in the water of the ocean and mineral springs, in marine molluscous animals, and in sea-weeds, from the ashes of which it is chiefly procured. At the ordinary temperature of the atmosphere it is a solid crystalline body. Iodine unites readily with chlorine, potassium.

dc., with the emission of light and great heat. It is a non-conductor of electricity, and, like oxygen and chlorine, is a negative electric. Like chlorine, it destroys vegetable colours, but with less energy. Its colour is bluish black or grayish black, of a metallic lustre. It is often in scales, resembling those of micaceous iron ore; sometimes in brilliant rhomboidal plates or in elongated octahedrons. The specific gravity of solid iodine is 4.947. At 225° it fuses, and enters into chullition at 347°. Its vapour is of an exceedingly rich violet colour, a character to which it owes the name of iodine. This vapour is remarkably dense, its specific gravity being 8.782. Iodine has a very acrid taste, and its odour resembles that of chlorine. It is an irritant poison; but in small doses, and cautiously administered, it has occasionally been of great service in certain forms of glandular disease. It is very sparingly soluble in water, but dissolves copiously in alcohol and in ether, forming dark brown liquids. It possesses strong powers of combination, and forms, with the pure metals, and most of the simple non-metallic substances, compounds which are termed iodides. With hydrogen and oxygen it forms hydriodic acid. Starch is a characteristic test of iodine, forming with it a compound of a deep blue colour. This test is so delicate that a solution of starch grouped into water containing less than a a characteristic test of iodine, forming with it a compound of a deep blue colour. This test is so delicate that a solution of starch dropped into water containing less than a millionth part of iodine is tinged blue by it. The great consumption of iodine is in medicine; it is employed in its pure state, and in the form of iodide of potassium.

Iodism (Yod.izm), n. In pathol. a peculiar morbid state produced by the use of iodine. Iodize (Yod.iz), nt. pret. & pp. iodized; ppr. iodizing. I. on wootspine, attendo, or tener, and also on cane-sugar, glucose, gum, dextrin, and other albuminous substances.

Ioite (fo-lit), n. [Gr. ton, a violet, and tithos, stone.] A silicate of magnesium, aluminium, and fron, a mineral of a violet blue colour, and ron, a mineral of a violet blue colour, with a shade of purple or black, called also Dichroite, because the tints along the two axes are unlike, and Cordierite. It occurs in six-sided rhombic prisms. Its varieties are the smoky-blue peliom and steinheilite. Ion (I'on), n. One of the elements of an electrolyte, or compound body undergoing electrolysation. Those elements of an electrolyte lysation. Those elements of an electrolyte which are evolved at the anode are termed anions, and those which are evolved at the cathode actions, and when these are spoken of together they are called ions. Thus water, when electrolysed, evolves two ions, oxygen and hydrogen, the former being an anion, the latter a cation.

Ionic (1-on'ik), a. [Gr. Ionikos.] Relating to Ionia, or to the Ionian Greeks.—Ionic order, one of the five orders of architecture. The distinguishing characteristic of this order is the volute of its capital. In the Grecian Ionic the volutes appear the same on the front and rearr being connected on order is the volute of its capital. In the Grecian Ionic the volutes appear the same on the fianks by a baluster-like form; through the external angles of the capitals of the corner columns, however, a diagonal volute is introduced. The Romans gave their Ionic four diagonal volutes, and curved the sides of the abacus. The Greek volute continues the fillet of the spiral along the face of the abacus, whereas in the Roman its origin is behind the ovolo. In the modern Ionic capital the volutes are placed diagonally, and the abacus has its sides hollowed out. The shaft, including the base, which is half a diameter, and the capital to the bottom of the volute, generally a little more, is about nine diameters high, and may be fluted in twenty-four flutes, with fillets between them; these fillets are semicircular. The pedestal is a little taller and more ornamented than the Doric. The bases used with this order are very various. The more ornamented than the Doric. The bases used with this order are very various. The Attic base is very often used, and with an astragal added above the upper torus makes a beautiful and appropriate base. The cornices of this order may be divided into three divisions — the plain Grecian cor-

Of this sort there are three South America. Of this sort there are three varieties, namely, the brown, red, and gray or gray-white, called also greater annulated ipecacuanha. As this is the only sort sent from Rio Janeiro, it is sometimes called Brazilian or Lisbon ipecacuanha. The root is hard, breaks short and granular (not fibrous), exhibiting a resinous, waxy, or farinaceous interior, white or grayish. Ipecacuanha is also obtained from the plants

Psychotria emetica, a native of New Gran-ada, and Richardsonia scabra, a Brazilian plant. The dust or powder of ipecacuanha, applied to any mucous surface, causes irritation and increased secretion from the part. It is chiefly employed to excite the stomach either to augmented secretion, or stolman either to augmented secretion, or to invert its action and produce vomiting. It is also capable, by being combined with other substances, of being directed to the skin, and producing increased perspiration; skin, and producing increased perspiration, as in the well-known Dover's powder. When given in very small doses it improves the appetite and digestive powers; in a somewhat larger dose it acts on the intestines, and in a still larger, from 15 to 20 grains, it occasions vomiting. The roots of other plants are used in tropical countries as emetics, and are often termed ipecacuanha. The name of American ipecacuanha is given The name of American ipecacuanha is given to the Euphovbia Ipecacuanha, a plant which grows in sandy places in North America. Sym. Fe. At wt. 56. It constitutes, according to some, about 2 per cent. of the whole mineral crust of the globe. Its occurrence in a native state, however, is exceedingly rare; but there are few mineral substances in which its presence may not be detacted. Such as its presence may not be detected. Such as contain it in certain forms and in sufficient contain it in certain forms and in sufficient quantity are called ores of iron. Iron exists in nature under four different states—the native state; that of an oxide; in combination with combustible bodies, particularly sulphur; and finally, in the state of salts. The principal ores of iron are—(1) Hæmatite or ferric oxide. (2) Magnetic or ferrosoferric oxide. (3) Clayband and blackband, which contain carbonate of iron. (4) Spathose or ferrous carbonate. (5) Iron pyrites or ferric sulphide. The cast-iron of commerce is obtained by the ore being calcined, or roasted, and thereby detached from its more volatile enquirities, and then exposed, along with certain proportions of coal or coke and lime, to intense heat in a blast furnace. By the action of these materials at a high tentlime, to intense heat in a blast furnace. By the action of these materials at a high temperature the oxygen and earthy matter of the ore are separated from the metal, which by reason of its greater density collects at the bottom of the furnace, and is run off into moulds, while the earthy matters float on the surface, and are run off as slag. This process is called smetting, and the iron in this state receives the name of pip-iron. It is converted into wrought or malleable from by a further process of purification called nuadding. It then becomes known in commerce as rod or bar iron. Cast-iron contains about 3-5 per cent. of carbon, malleable-iron about 0-4 per cent; intermediate between the two in this respect stands steel, which contains about 1 per cent. of carbon, and possesses certain properties steel, which contains about 1 per cent, or carbon, and possesses certain properties that render it perhaps the most important form in which this metal is employed, the range of its application extending from the minute and delicate balance-spring of a watch to the large and ponderous war yessel. watch to the large and ponderous war vessel.

Icel. ey, Dan. ö or öe, Fris. ooge, all meaning island, seems rather to show, however, that the first part of the word has the meaning of island by itself, and that edland was formed by an erroneous etymology; comp. also E. eyot, att, a small island in a river, and such names as Chelsea, Battersea, Anglesea or Anglesey, Chertsey, Alderney, Orkney, where the last element means island. The s is due to a supposed connection with L. insula, O.Fr. isle. See ISLE.] 1. A tract of land surrounded by water, whether of the sea, a river, or a lake: in contradistinction to mainland or continent.—2. Anything resembling an island, as a large mass of floating ice.—Islands of the ment.—2. Anything resembling an island, as a large mass of floating ice.—Islands of the blessed, in Greek myth. the Happy Islands, supposed to lie westward in the ocean, whither after death the souls of the virtuous

whither after dearn one sound of the state were transported.

Island (fland), vt. 1. To cause to become or appear like an island or islands; to isolate by surrounding, as with water.

Stand upon the peak of some isolated mountain at

daybreak, when the night mists first rise from off the plains, and watch their white and lake-like fields, as they float in level bays and winding gulfs about the islanded summits of the lower hills.

Ruskin.

2. To dot, as with islands.

Not a cloud by day With purple islanded the dark-blue deep.

Islander (i'land-er), n. An inhabitant of an

island.

Islandy† (fland-i), a. Pertaining to islands; full of islands. Cotgrave.

Isle (l), n. [O.Fr. isle, Fr. ile, Prov. isla, L. insula, an island. Mr. Marsh, however, remarks that 'the fact that Robert of Gloucester, and other early English writers, wrote ile or yle at a time when the only French orthography was isle, is a strong argument against this derivation. It is more probably a contraction of island, the A. Sax. caland, aland. induad. and the s was inserted in ealond, igland, and the s was inserted in both because when Saxon was forgotten the words were thought to have come through the French from the Latin insula.'] 1. An island. [Now chiefly or altogether poetical.]

The zeles shall wait for his law. Is. xlii. 4.

2. In entom. see ISLET. 2.

Isle (il), v.t. pret. & pp. isled; ppr. isling.
To cause to become or appear like an isle; to isolate; to island; to environ.

Isled in sudden seas of light,
My heart, pierced through with fierce delight,
Bursts into blossom in his sight. Tempson.

Isle (I'zl), n. Same as Aisle (which see). Islet (I'et), n. 1. A little isle. 'The cressy islets white in flower.' Tennyson.—2. A spot within another of a different colour, as on the wing of an insect, the blossom of a

A but less vivid hue
Than of that islet in the chestnut-bloom
Flamed in his cheek.

Tennyson.

-Ism (izm). [Gr. suffix ismos.] A suffix implying doctrine, theory, principle, system, or practice of; abstract idea of that signified or practice or; abstract mean that significate by the word to which it is subjoined; as, monotheism, spiritualism, republicanism, mesmerism, Presbyterianism, libertinism. [Ism (izm), n. [From its common use as a suffix in words signifying doctrine or theory.]

A doctrine or theory, but more especially a pretentious or absurd one; a crotchety or visionary speculation: generally used con-temptuously; as, away with your isms and

ologies.

Ismaelian (iz-ma-č'li-an), n. A member of the Mohammedan sect which maintained that Ismael, and not Moussa, ought to be Imaum. In the tenth century they formed a secret society, from which sprang the Assassins. Brever.

Isnardia (is-nar'di-a), n. [In memory of Antoine Dante Isnard, member of the Aca-

signifying equal.

Isobar, Isobare (I'sō-bār, I'sō-bār), n. [Gr. isos, equal, and baros, weight.] In phys. geog. a line drawn on a map to connect those places on the surface of the globe at which the mean height of the barometer at sea-

level is the same.

Isobaric (ī-sō-bar'ik), a. Same as Isobaro-

Isobarism (I-sob'ar-izm), n. [Gr. isos, equal, and baros, weight.] Equality or similarity of weight.

Isobarometric (i-sō-bar'ō-met"rik), a. [Gr. isos, equal, baros, weight, and metron, measure.] In phys. geog. indicating equal barometric pressure.—Isobarometric line. Same as Isobar.

Same as Isobar.

Isobrious (I-sobri-us), a. [Gr. isos, equal, and briad, to be strong.] In bot. a term applied to the dicotyledonous embryo, because both lobes seem to grow with equal vigour.

Isocardia (I-sō-kär'di-a), n. [Gr. isos, equal, and kardia, the heart.] A heart-shaped shell with separated, involuted, and diverging heaks.

site with separated, involuted, and diverging beaks. Socheim (Foskim), n. [Gr. isos, equal, and cheima, winter.] In phys. geog. a line drawn on a map through places on the surface of the globe which have the same mean winter temperature.

Isocheimal, Isocheimenal (ī-sō-kī'mal, ī-sō-kī'men-al), a. Of the same mean winter temperature.—Isocheimal line, in phys. geog. same as Isocheim.

Isocheimene, Isochimene (ī-sō-kī'mēn), n.

Same as Isocheim.

Isocheimonal, Isochimonal (i-sō-kī'mon-al), a. Same as Isocheimal.

Isochimal, Isochimenal (i-sō-kī'mal, i-sō-kī'men-al), a. Same as Isocheimal.

The lines passing through all places which have an equal temperature for the summer or the winter half of the year have been called respectively isotheral and isochimal lines.

and trechinal lines.

Isochromatic ('sō-krō-mat''ik), a. [Gr. isos, equal, and chrōma, colour.] Having the same colour. In certain experiments with doubly refracting crystals the decomposed light forms a double series of coloured rings or curves of different forms arranged in a certain order, each away in the one series. certain order; each curve in the one series having one corresponding to it both in form and colour in the other. The two curves or lines that have the same tint are called isochromatic lines.

Isochronal, Isochronous (I-sok'ron-al, I-sok'ron-us), a. (Gr. 1808, equal, and chronos, time.) Uniform in time; of equal time; performed in equal times. Two pendulums which vibrate in the same time are iso-chronal; also, the vibrations of a pendulum in the curve of a cycloid have the same proerty, being all performed in the same time whether the arc be large or small.

The very physical basis of music is rhythm, since the distinction between what we recognize as musical sounds and those which are not so consists in the sochronous character of the vibrations in the for-mer. Edin, Rev.

Isochronally (I-sok'ron-al-li), adv. So as to be isochronal.

Isochronism (isokron-izm), n. The state or quality of being isochronous; the property of a pendulum by which it performs its vibrations in equal times.

Isochronon (I-sok'ron-on), n. [See Iso-CHRONAL.] An equal time-keeper; a clock designed to keep perfectly accurate time. Isochronous (I-sok'ron-us), a. See Iso-

Isochrous (i-sok'rus), a. [Gr. isochroos, like-

ISOCINTUS (1-308-7185), a. (Gr. *2000-7008, IRC-coloured — isos, equal, and chroa, colour.]
Being of equal colour throughout.
ISOCIII (1-30-kilin'al, I-56-kilin'-ik), a. (Gr. isos, equal, and klin'ā, to incline.]
Of equal inclination or dip.—Isoclinial or isoclinic lines, in magnetism, a term applied to curves connecting those places in the two hemispheres where the dip of the magnetic hemispheres where the dip of the magnetic

nemispheres where the dip of the magnetic needle is equal.

Isocrymal (ī-sō-krī'mal), α. Pertaining to or having the nature of an isocryme.

Isocryme (Γ'sō-krīm), n. [Gr. isos, equal, and hrymos, cold.] In phys. geog. a line drawn on maps showing the places having the care mean temperature during the

the same mean temperature during the coldest months of the year.

Isodiabatic ('fsō-di'a-bat''lk), a. [Gr. isos, equal, and diabainō, to pass through—dia, through, and bainō, to pass.] In thermodynamics, a term applied to each of a pair of lines on entrees on a diagram—the one aynames, a term applied to each of a pair of lines or curves on a diagram—the one exhibiting the variations in the density of a fluid which take place during the process of raising its temperature, the other the corresponding variations produced by the abstraction of portions of heat equal to those added in the former process. From the lines exhibiting the results of the addition and abstraction of equal portions they are said to be isodification in respect of each are said to be isodiabatic in respect of each

Isodimorphism (I'sō-dī-mor"fizm), n. [Gr. isos, equal, dis, double, and morphe, shape.] Isomorphism between the two forms severally of two dimorphous substances.

Isodimorphous (i'sō-dī-mor"fus), a. Having the quality of isodimorphism. Isodomon, Isodomum (ī-sod'o-mon, ī-sod'o-mum), n. [Gr. isos, equal, and domē, struc-

ture.] One of the methods of building walls among the Greeks, in which the stones forming the courses were of equal thickness and equal length, and so disposed that the vertical joints of an upper course were immediately over the middle of the stones forming the lower course. See PSEUDISODOMON.

Isodynamic (i'sō-di-nam'ik), a. [From Gr. isos, equal, and dynamis, power.] Having equal power or force.—Isodynamic lines, in magnetism, lines of equal power or intensity: a term applied to lines connecting those places where the intensity of the terrestrial magnetism is equal. They resemble in form and position the isoclinic lines.

Isodynamous (i-sō-din'am-us), a. [Gr. isos, the same, and dynamis, force.] Having equal force; of equal size; in bot same as Isobrious.

Isodees (i-sō-die'le), n. [Gr. isos, equal, and etos, the year, because the plant is the same throughout the year.] A genus of plants of the nat. order Lycopodiacem or club-moss tribe. The I. lacustris, or European quill-wort, is an aquatic plant growing in the bottoms of lakes in the north of löngland, Wales, and Scotland.

Isogeotherm (i-sō-j-jō-cherm), n. [Gr. isos. equal, gē, the earth and it.]

Wales, and Scotland.

Isogeotherm (i-sō-jē'ō-thèrm), n. [Gr. 1808, equal, gē, the earth, and thermē, heat.] In phys. geog. an imaginary line or plane under the earth's surface passing through points having the same mean temperature.

Isogeothermal (i-sō-jē'ō-thèr"mal), a. In phys. geog. pertaining to or having the nature of an isogeotherm.

Isogonic (i-sō-gon'ik), a. [Gr. 1808, equal, and gorhā, an angle.] Having equal angles.

—Isogonic lines, in magnetiem, lines connecting those places on the globe where the deviation of the magnetic needle from the true north is the same.

Isography (i-sog'ia-d), n. [Gr. 1808, equal,

true north is the same.

18ography (f-sografh), n. [Gr. isos, equal, and graphē, a writing.] The imitation of handwriting.

18ohyetose (f-sō-hi/et-ōs), n. [Gr. isos, equal,

Isohyetose (1-sö-hi'et-os), n. [Gr. 1808, equal, and hyetos, rain.] In phys, geog. a line connecting those places on the surface of the globe where the quantity of rain which falls annually is the same.

Isolable ('sō-la-bl or is'ō-la-bl), a. That can be isolated; specifically, in chem. capable of being obtained pure, or uncombined with any other substance.

of being obtained pure, or uncombined with any other substance. Isolate (1'sō-lāt or is'ō-lāt), v.t. pret. & pp. isolated; ppr. isolating. [Fr. isoler, It. isolate, isolate, detached; from isola—L. insula, an island.] 1. To place in a detached situation; to place apart; to insulate: often used refexively; as, he isolated himself from all society.—2. In elect. to insulate. See INSULATE.—3. In chem. to obtain a substance free from all its combinations.

Isolated (1'sō-lāt-ed or is'ō-lāt-ed), p. and a.

1. Standing detached from others of a like kind; placed by itself or alone.

Shot isolated sentences were the mode in which

Short isolated sentences were the mode in which ancient wisdom delighted to convey its precepts for the regulation of human conduct. Warburton.

2. In elect the same as Insulated.—3. In chem. pure; freed from combination. Isolatedly (['sō-lāt-ed-li oris'ō-lāt-ed-li),adv. In an isolated manner.

In an isolated manner.

Isolation (1-50-lä/shon or is-ō-lä/shon), n.
State of being isolated or alone. 'Isolation from the rest of mankind.' Milman.

Isologous (i-sol/o-gus), a. [Gr. isos, equal, and loyos, proportion.] In chem. having similar proportions or relations: said of groups of homologous terms, in which the radicles, by combining with a series of similar compounds; thus, the hydrocarbon group, by its oxide, chloride, alcohol, &c., is isologus with the allyl group, which has also its oxide, chloride, alcohol, and the like. Miller. Isomeric, Isomerical (i-50-mer'ik,i-50-mer'ik-al), a. In chem. pertaining to or characterized by isomerism.

is-ai, a. In chem. pertaining to or characterized by isomerism.

Isomeride (i-som'er-id), a. In chem. a compound that exhibits the properties of isomerism with reference to some other compound.

Isomerism (i-som'er-izm), a. [Gr. isos, equal, and meros, a part.] In chem. identity or close similarity of composition with difference of physical or both chemical and physical properties. There are three different cases of isomerism: first, where the compounds have the same percentage composition, while their vapour densities are different; second, where the compounds have the same ultimate composition and the same vapour density, but differ in physical properties, and also in their behaviour towards the same reagents; third, where the compounds have the same composition and the same vapour density, and by their behaviour towards reagents yield the same compound,

or at any rate show that they are members or at any rate show that they are members of the same series, but nevertheless differ in physical properties. The first two cases are properly called cases of polymerism and metamerism respectively, while the last is isomerism proper. The facts of isomerism are generally explained by assuming that there exists a difference in the arrangement of the atoms which form the isomeric molecular.

Isomeromorphism (ī'sō-mer'ō-mor"fizm),n [Gr. isos, equal, meros, a part, and morphe, form.] Incrystal isomorphism between subform. I in crystat. isomorphism between substances having the same atomic proportions.

Isomerous (i-som'er-us), a. [Gr. tsos, equal, and meros, a part.] I. In bot. a term applied to a flower whose organs are composed each of an equal number of parts.—2. In chem. a term applied to isomorphism subsisting be-tween substances of like composition. See under ISOMORPHISM

under ISOMORPHISM.

ISOmetric, Isometrical (i-sō-metrik, i-sō-metrik, al), a. 1. Pertaining to or characterized by equality of measure.—2. In crystal monometric; tessular.—Isometrical perspective or projection, a method of drawing plans of machines, &c., whereby the elevation and ground-plan are represented in one view. See under PERSPECTIVE.

See under Perspective.

Isomorphism (1-85-morfizm), n. [Gr. isos, like, and morphs, form.] A similarity of crystalline form; as, (a) between substances of like composition or atomic proportions, as between arsenic acid and phosphorous acid, each containing five equivalents of oxygen. (b) Between compounds of unlike composition or atomic proportions, as between the metal arsenic and oxide of iron, the rhombohedral angle of the former heing 85° 41′, of the latter 86° 4′. The first of these is sometimes distinguished as isomerous or isonomic isomorphism; the second as heteromerous or heteronomic isomorphism. Dana; Goodrich.

the property of isomorphism.

Isomorphous (i-sō-mor'fus), a. Exhibiting the property of isomorphism.

Isomandra (i-sō-nan'dra), n. A genus of plants, nat order Sapotacese, including the gutta-percha plant (I. Gutta). See GUTTA PRECHA.

Isonomic (ī-sō-nom'ik), a. Of or pertaining

ISOnomic (I-sō-nom'ik), a. Of or pertaining to isonomic (I-sō-nom'ik), a. Of or pertaining to isonomy; the same or equal in law or right; one in kind or origin; specifically, in chom. a term applied to isomorphism subsisting between two compounds of unlike composition. See under Isonorphism subsisting between two compounds of unlike composition. See under Isonorphism and nomos, law.] Equal law; equal distribution of rights and privileges. Isonathy (I-sop'a-thi), n. [Gr. isos, equal, and pathos, suffering.] In med. (a) a term borrowed from some German writers to designate the theory that diseases are cured by the products of the diseases themselves, as, for example, that small-pox is cured by homeopathic doses of variolous matter; the cure of disease by the virus of the disease. (b) The theory that a diseased organ is cured by eating the same organ of a healthy animal. animal

Isoperimetrical (i-sō-per'i-met'rik-al), a.
1. Of or pertaining to isoperimetry.—2. Having equal boundaries; as, isoperimetrical figures or bodies.

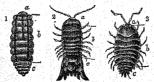

Isoperimetry (i'sō-per-im"et-ri), n. [Gr. isos, equal, and perimetron, circumference.] In geom. the science of figures having equal perimeters or boundaries.

perimeters or boundaries.

Isophorous (i-sof'ō-rus), a. [Gr. isos, the same, and pherō, to bear.] In bot. transformable into something else; thus, Actinia is an isophorous form of Dendrobium.

Isopod, Isopode (i'sō-pod, i'sō-pōd), n. A crustacean of the order Isopoda.

Isopoda (i-sop'o-da), n. pl. [Gr. isos, equal, and pous, podos, the foot.] An order of crus-

taceans having sessile eyes and a depressed body; the thoracic and abdominal wings

free, except the first thoracic, which is united with the head. The feet are of equal size and move in the same direction, a point of contrast with the amphipods. The majority of them reside in water, and those which live on land require a certain amount of atmospheric moisture in the localities which they inhabit to keep the gills moist, so that they may respire properly. Many of them are parasitic. By Milne-Bdwards they are divided into three sections, termed respectively from their habits the Sedentary, the Natatory, and the Cursorial.

Natatory, and the Cursorial.

Isopodiform (i-sō-pod'i-form), a. In zool. formed like an isopod; specifically, a term applied to the larve of saprophagous hexapods having an oblong body, a distinct thoracic shield, and a vent provided with

filaments or lamina

isopodous, Isopod (f-sop'o-dus, I'sō-pod), a.

Relating to the order of Isopoda.

Relating to the order of Isopoda.

Isopyre (f'sō-pir), n. [Gr. isos, like, and pyr, fire.] A mineral of a grayish or black colour which occurs massive. It is found in Cornwall imbedded in granite.

Isosceles (f-sos'se-lez), a. [Gr. isos/celes—tsos, equal, and skelos, only that are equal; as, an isos-celes triangle.

Isostemonous (f-sō-stem'on-us), a. [Gr. isos, equal, and stēmān, a stamen.] In bot. having the stamens equal in number to the petals.

petals.

Isotheral (i-soth'er-al), a. Of or pertaining to, or of the nature of an isothere; indicating the distribution of temperature by means of an isothere; as, an isotheral chart. See extract under Isochimal.

Isothere (Tso-ther), n. [Gr. isos, equal, and theros, summer.] In plus, geog, an imaginary line over the earth's surface, passing through points having the same mean sum-

through points having the same mean summer temperature.

Isotherm (i'sō-therm), n. [See below.] An imaginary line over the earth's surface passing through points having the same mean annual temperature, so that a series of such lines exhibits the distribution of temperature over the earth's surface; also, any similar line passing through points having the same mean temperature, but not exclusively the annual mean temperature; also, a similar line based on the distribution of temperature in the waters of the ocean.

ocean.

Isothermal (ī-sō-ther'mal), a. [Gr. isos, equal, proper, and therme, heat.] In phys. geog. of or pertaining to an isotherm or isogeog. of or pertaining to an isotherm or isotherms; having the nature of an isotherm; having reference to the geographical distribution of temperature as indicated by isotherms; llustrating the distribution of temperature by means of a series of isotherms; as, an isothermal line; the isothermal relations of different continents; an isothermal chart.—Isothermal line, an isotherm.—Isothermal zones, spaces on opposite sides of the equator having the same mean temperature, and bounded by corresponding isothermal lines. thermal lines.

Isotherombrose (ī'sō-ther-om"brōs), a. [Gr.

Isotherombrose (i'sō-ther-om''brōs), a. [Gr. isos, equal, theros, summer, and ombros, rain.] In phys. goog. a term employed to designate lines connecting places on the surface of the globe where the same quantity of rain falls during the summer.

Isotonic (i-sō-ton'ik), a. [Gr. isos, equal, and tonos, tone.] Having or indicating equal tones; in music, a term applied to a system consisting of intervals in which each concord is alike tempered, and in which there are twelve equal semitones.

Isotrimorphism (isō-tri-mor'fizm), n. [Gr. isos, of Gr. i

Isotrimorphism ("sō-tri-mor"fizm), n. [Gr. 1808, equal, tris, three, and morphis, shape.] Isomorphism between the three forms severally of two trimorphous substances. Good-

rich.

Isotrimorphous ('isō-trī-mor"fus), a. Having the quality of isotrimorphism. Goodrich.

Isotropic (i-sō-trop'ik), a. [Gr. isos, equal, and tropē, a turning, from tropō, to turn.]

A term applied to bodies whose elastic forces are alike in all directions.

Ispahanee (is-pa-han'ē), a. Of or pertaining to Ispahane (is-pa-han'ē), n. A native or inhabitant of Ispahan.

Ispahanee (is-pa-han'ē), n. A descendant of Israel or Jacob; a Jew.

Israelitie (iz'ra-el-it), n. A descendant of Israelitie, Israelitish (iz'ra-el-it'ik, iz'ra-el-it'ish), a. Pertaining to Israel; Jewish; Hebrew.

Issuable (ish'ū-a-bl), a. 1. That may be issued,—2. Pertaining to an issue or issues; that admits of issue being taken upon it; in that admits of issue being taken upon it; in which issues are made up; as, an issuable plea; an issuable term.—Issuable plea, a plea upon which a plaintiff may take issue and go to trial upon the merits.

Issuably (ish'ū-a-bli), adv. In an issuable manner: by way of issue. Pleading issuably. Burrill.

Issuance (ish'ū-ans), n.
The act of issuing or giving out; as, the issuance of rations.

of rations.

Issuant (ish'ŭ-ant), ppr.
In her. issuing or coming
up. It is used to express
a charge or bearing rising or coming out of another charge or bearing. When a lion or other animal is

a lion or other animal is blazoned as issuant, only the upper half of such animal is depicted.

Issue (ish'u), n. [Fr. issue, issue, outlet, event, from 0. Fr. issue, to go out, to flow forth, and thatfrom Lexeo, exive, to go out—ex, out, and eo, to go.] I. The act of passing or flowing out; a moving out of any inclosed place; egress: applied to water or other fluid, to smoke, to a body of men, &c.; as, an issue of water from a pipe, from a spring, or from a river; an issue of blood from a wound, of air from a bellows: an issue of neople from a door an issue of blood from a wound, of air from a bellows; an issue of people from a door or house.—2. The act of sending out; delivery; as, the issue of an order from a commanding officer or from a court; the issue of money from a treasury.—3. That which proceeds, flows, or is issued or sent out; as, (a) the whole quantity sent forth or issued of continuous as issued of contenues to. at one time; as, an issue of government or bank notes; yesterday's issue of the Times. (b) What happens or turns out; event; con-sequence; end or ultimate result; as, our present condition will be best for us in the

Some awful moment, to which Heaven has joined Great issues, good or bad for humankind.

Wordsworth.

(c) Progeny; a child or children; offspring; also, all persons descended from a common ancestor; all lineal descendants; as, he had ssue a son; and we speak of issue of the whole blood or half blood. 'If the king should without issue die.' Shale. (a) Produce of the earth, or profits of land, tenements, or other property; as, A. conveyed to B. all his right to a term for years, with all the issues, rents, and profits. (e) A flux of blood. Mat ix 20. (f) In law, the close or result of pleadings; the point or matter depending in a suit on which two parties join and put their cause to trial; a single, definite, and material point issuing out of the allegations of the parties, and consisting regularly of an affirmative and negative. It is either an issue in law to be determined by the court, or in fact to be ascertained by (c) Progeny; a child or children; offspring; It is either an usue in that to be determined by the court, or in fact to be ascertained by a jury. Hence—(g) A material point turning up in any argument or debate on which the parties occupy affirmative and negative the parties occupy annual and negative positions, and on which they base the result of the argument or debate; the position assumed when one party takes the negative, the other the positive side on an important point.

4. In surg. an artificial ulcer made in some 4. In sury, an arthrelar liter made in some part of an animal body to promote a secretion of pus; a fontanel.—Issue-pea, a pea or similar round body employed for the purpose of maintaining irritation in a wound of the skin called an issue. The seed of the or the Skin called an usua. The seed of the common garden pea is frequently used, but the young unripe fruits of the common orange are more commonly employed. For this purpose the fruits are dried, and afterwards turned in a lathe to make them round and smooth

Issue (ish'u), v.i. pret. & pp. issued; ppr. issued; [See the noun.] 1. To pass or flow out; to run out, as from any inclosed place; to proceed, as from a source; as, water issues from springs; blood issues from

wounds; sap or gum issues from trees; light issues from the sun.

Ere Pallas issued from the Thunderer's head. Pope. 2. To go out; to rush out; as, troops issued from the town and attacked the besiegers.— 3. To proceed, as progeny; to be derived or descended; to spring.

Of thy sons that shall issue from thee. 2 Ki, xx. 18. 4. To be produced, as an effect or result; 4. To be produced, as an effect or result; to grow or accrue; to arise; to proceed; as, rents and profits issuing from land, tenements, or a capital stock.—5. In law, to come to a point in fact or law on which the parties join and rest the decision of the cause.—6. To close; to end; to terminate; as, we know not how the cause will issue. Trans (ight) at I. To accel and it issue. as, we know not now the cause wit issue.

Issue (ish'ū), v.t. To send out; to deliver for use; to deliver authoritatively; to put into circulation; as, to issue provisions from a store; to issue an order from the department of war; to issue a writ or precept; to issue money from a treasury or notes from a bank.

The commissioners should issue money out to no other use.

A pronoun of the neuter gender, generally classed as a demonstrative, and corresponding with the masculine pronoun he, and the feminine she, having the same plural they. 'Keep thy heart, with all diligence: for out of it

she, having the same plural they. 'Keep thy heart with all diligence; for out of it are the issues of life.' Prov. iv. 23. Here it is the substitute for heart.—2. It is much is the substitute for neart.—2. It is much used as the nominative to verbs called impersonal; as, it rains; it snows. In this case there is no determinate thing to which it can be referred.—3. Very often it is used to introduce a sentence, preceding a verb as a nominative, but referring to a clause or distinct member of the sentence following. Whis has been called the measurement as a first product of the sentence of the sente or distinct member of the sentence rollowing. This has been called the prospective use of it. 'It is well ascertained that the figure of the earth is an oblate spheroid.' What is well ascertained? The fact that the figure of the earth is an oblate spheroid; it (that) is well ascertained. Here it represents the clause, 'the figure of the earth,' &c. If the order of the centrum is inverted the new order of the sentence is inverted the use of it is superseded, thus: That the figure of the earth is an oblate spheroid is well ascertained. Similarly it is often used for a prethree genders; as, It is I, be not afraid; it was Judas who betrayed Christ; it is thou; it was they who did so.

'Tis these that gave the great Apollo spoils. Pope. I is these that gave the great apolic spouls. Post-When a question is asked it follows the verb; as, who was it that hetrayed Christ? 5. It is used also for the state of a person, state of matters, condition of affairs, or the like; as, has it come to this?

How is it with our general? 6. It is used after intransitive verbs very indefinitely, and sometimes imports a ludicrous shade of meaning, especially after a noun used as a verb for the occasion. In this use it is rarely employed in an elevated

this use it is rarely employed in an electroc-style. If Abraham brought all with him, it is not probable that he meant to walk it back for his pleasure. Rateigh. The Lacedemonians, at the straits of Thermopyle, when their arms failed them, fought it out with their nails and teeth. Drywen.

This apoplexy is, as I take it, a kind of lethargy.

I have read the cause of his effects in Galen.

Shak.

When the transition from the possessive his to its was taking place the old dialectal and uninflected possessive it was frequently used, as it is still in Scotland. Several intised, as it is some in coording. Several instances of this occur in Shakspere, and at least one in the Bible of 1611, Lev. xxv. 5, 'That which groweth of it own accord;' now changed to its.

Do, child, go to it grandam.

Do, child, go to it grandam. Shak.

It knighthood shall do worse. It shall fright all it friends with borrowing letters.

It such phrases as 'It is me,' 'It is him,' it is exceedingly indefinite. Here me and him may be regarded as a sort of nominatives, like the French moi in the phrase 'C'est moi.' Professor Bain says it may be confidently affirmed that, with good speakers, in the case of negation, 'It is not me' is the usual practice. 'It is I' is, however, suited to occasions of dignity; as, 'Jesus spake unto them, saying, Be of good cheer; it is I; be not afraid.' In old English the substantive verb often agrees with the nominative following; thus we find, instead of 'It is I,' 'It am I.' It am I

'It am I.'

Jain, Jaina (jān, jān'a), n. One of a Hindu religious sect, which, from the wealth and influence of its members, forms an important division of the Indian population. The name signifies a follower of dina, one of the denominations of their defield saints. The sect was very numerous and important in the eighth and ninth centuries of the Christian era, and they have left many monuments of their skill and power in the fine temples built in different parts of the country. Jainism was an offshoot of Buddhism, try. Jainism was an offshoot of Buddhism, with which it has many leading doctrines in common, but is distinguished from it by its recognition of a divine personal Ruler of

all, and by its political leanings towards Brahmanism. The Jains deny the divine origin and infallible authority of the Vedas;

Brahmanism. The Jains deny the divine origin and infallille authority of the Vedas; they reverence certain holy mortals, who have acquired by self-denial and mortification a station superior to that of the gods; and they manifest extreme tenderness for animal life. They aftirm that the world has existed from all eternity, not having been created, and that it will exist for ever. Jaina (faira), a. Of or pertaining to the Jains or their creed.—Jaina architecture, which appears to be a modification or development of Buddhism architecture, as Jainsims is an outgrowth of Buddhism. In Buddhist architecture no structural arch occurs, but in the remains of Jaina architecture, chiefly consisting of temples, we meet with a horizontal architatic, however, is its dome, built horizontally and resting commonly upon eight pillars arranged octagonally; but these eight pillars are almost never left to themselves, the base being made square by the addition of four others at the angles. There are many small buildings so constructed, that is with only twelve pillars, but oftener two more are added on each face, making twenty-eight, or six on each face, making twenty-eight, or six on each face, making thirty-six, and so on. The added on each face, making twenty, or four on each face, making twenty-eight, or six on each face, making thirty-six, and so on. The principal object in a Jaina temple is a cell lighted from the door, containing a cross-legged figure of the saint to whom the temple is dedicated. The cell is always terminated upwards by a pyramidal spire-like roof, and there is a portico attached, generally of considerable extent, and in most instances surmounted by a dome. The whole is inclosed in a court-yard, surrounded by a double colonnade of smaller pillars, which form porticos to a range of cells, each occupied by the cross-legged image of a saint. There are also Jaina towers, such as towers commemorative of victory, very elatowers commemorative of victory, very elaborate in construction and ornamentation. borate in construction and ornamentation. The civil architecture presents no feature of interest, there being nothing to distinguish it from that of the Hindus. Jaina architecture was at its best about the eleventh or twelfth century of our era. Jainism (jairizm), n. The principles, doctrines, or creed of the Jains.

2. A buffoon; a merry-andrew; a person formerly retained by persons of rank to make sport for them. The professional jesters, at least those of older times, usually wore a motley or particular coloured coat, breeches and hose in one, and a cap or cowl of gay colours fur-nished with bells and asses' ears, or crowned with a cock's comb.
The jesters at
the courts of
some sovereigns were men of no small import-ance, and often had much influence with their masters. The

last jester in this country regularly attached to the royal household seems to have been Archie Armstrong, the jester of James I. and Charles I.

The Jesuits form the most celebrated of all the Roman Catholic most celebrated of all the Roman catholic religious orders; they have ever since their origin been one of the main bulwarks of the Church of Rome, and have exercised immense influence in the destinies of the Christian world. So formidable and dangerous was their political influence supposed to be great in Power Certains accountified. christian world. So formidable and dangerous was their political influence supposed
to be, even in Roman Catholic communities,
that the troubles occasioned by their presence often ended in their expulsion. Thus,
though the order was founded only in 1536,
the Jesuits were driven from France in
1504, but recalled in 1605; they were expelled from England in 1604, from Venice
in 1606, from France in 1764, from Spain in
1767, and from Naples in 1768. In 1773 the
order was nominally (and as was supposed
finally) suppressed by Pope Clement XIV.
but it was revived in 1814. They have since
been expelled from various countries. The
body is divided into four classes: (1) Professed, who, having passed through all preparatory stages, which commonly extend
over ten or twelve years, or even a longer
period, have solemnly taken the vows, including obedience to the pope: (2) Coadjutors, spiritual and temporal; the former,
who have completed their studies and been

Jury (jūri), n. [O. Fr. jurie, an assize, from Fr. juver, L. juvo, to swear.] 1. A certain number of men selected according to law, impannelled, and sworn to inquire into or to determine facts, and to declare the truth according to the evidence legally adduced. Trial by jury signifies the determination of facts in the administration of civil or criminal justice by a number of men, generally facts in the administration of civil or criminal justice by a number of men, generally twelve, sworn to decide facts truly according to the evidence produced before them. The juries at present in use in England in the ordinary courts of justice are grand-juries, petty, petit, or common juries, and special juries. Grand-juries are exclusively incident to courts of criminal jurisdiction; their office is to evanuine jury charges of incident to courts of criminal jurisdiction; their office is to examine into charges of crimes brought to them at assizes or sessions, and if satisfied that they are true, or at least that they deserve more particular examination, to return a bill of indictment against the accused, upon which he is afterward tried by the petty jury. A grand-jury must consist of twelve at the least, but in practice a greater number usually serve, and twelve must always concur in finding every indictment. Petty or common juries consist of twelve men only, and are appointed to try all cases both only, and are appointed to try all cases both civil and criminal. The jury, after the proofs of a cause are summed up, unless the case be yery clear, withdraw from the bar to consider regarding their verdict; and, in order to avoid intemperance and causeless order to avoid intemperative and causeress delay, are kept without drink, fire, or candle, unless by permission of the judge, till they are all unanimously agreed. Special juries are used when the causes are of too great nicety for the discrimination of ordinary juries. Every person legally entitled to be called an esquire, every person of higher degree, as a banker or merchant, and every person occupying a private dwelling-house, or any premises, or a farm rated on certain values specified in 33 & 34 Vict. lxxvii. 6, is qualified and liable to serve on special juries. qualified and liable to serve on special juries. According to the law of Scotland, the number of the jury in criminal cases is fifteen; and the majority of that number determine what the verdict shall be. In civil cases, and in revenue cases before the Court of Exchequer, the number of the jury is twelve, and the jury are not required to be unanimously agreed in their verdict. In all cases of high treason the jury also consists of twelve, and their verdict must be unanimous, as in Eurland. In Scotland there is mous, as in England. In Scotland there is no grand-jury. — Challenge of jurors. See CHALLENGE, 7.—2. A body of men selected to adjudge prizes, &c., at a public exhibition tion.

K.

K, the eleventh letter and the eighth consonant of the English alphabet, representing one of the sounds of the original Indo-European alphabet. The letter was commonly employed in Greek, and in the oldest period of Latin, though hardly used in classical Latin. Nor is it used by the Romance languages except in a few borrowed words. In the Teutonic languages, on the other hand, it is much employed. In Anglo-Saxon k was occasionally used, but c was regularly employed for the same sound, being always hard (even before e and i). Up till the thirteenth century this letter was seldom used. It gradually became commoner, however, when c had partly lost its own special force, and now has as its most characteristic function the representation of the hard, guttural sound before the vowels e K, the eleventh letter and the eighth concharacteristic function the representation of the hard guttural sound before the vowels e and b, e being written before a, e, and u. At the end of monosyllabic stems it is very common, and if the preceding vowel sound is short this letter is in effect doubled by the insertion of e before it; if the simple vowel is long this is indicated by an e placed after the k. K has always the same sound, according to which it is classed as a guttural mute, explosive, or momentary consonant, and represents a hard or surd articulation,

produced by pressing the root of the tongue against the palate, with a depression of the lower jaw and opening of the teeth. It is closely allied to the sound of g in go, from which it differs only in the fact that it checks or stops the emission of breath instead of voice. It is less closely allied to the sound of ng in ring, which is pronounced with the same contact of the tongue with the unper part of the mouth, but the wylla with the same contact of the tongue with the upper part of the mouth, but the uvula is allowed to drop, and the voice goes through the nose. As already intimated, at the beginning of a syllable it is hardly found in pure English words before any other vowel except e and i. Nor is it ever doubled, ck being used for kk, as mentioned above. Formerly, k was added to e in certain words of Latin or Greek origin, as in musick, publick, republick, but is now omitted as superfluous. Kn forms a common initial combination in Kn forms a common initial combination in An forms a common initial combination in English words, but in this position the k is now silent, as in know, knife, knee, although in some districts of Britain, as in the north of Scotland, its sound is still heard, as it is in German words beginning with this combination. Before r or l as an initial combination this sound is represented by c, as in cream, clean, while an initial k sound and s as sound combined to the combination s is considered by s. a w sound coming together are commonly

written qu, as quake, queen (A. Sax. cweccan, cwên). According to Grimm's law when the same roots occur in English and Sanskrit, or the languages with which Sanskrit usually agrees, Greek, Latin, &c., the English k (like that of the Gothic and Low German dialects generally) represents the gof the series of languages mentioned, and when the same roots occur in English and Old High German, the English k represents the Old High German ch; thus, E. kin is the Gr. genos, L. genus, and the O. H.G. chunni.—As a contraction K stands for Knight, as K. B., Knight of the Bath; K. C., Knight of the Gatter; K. C.B., Knight Commander of the Bath; K. T., Knight of the Thistle; and K. H., Knight of Hanover.

side of the lumbar vertebræ, surrounded with fatty tissue. They are of a reddish-brown colour, and secrete the urine. Each

kidney consists of a cortical or outer part, and a medullary or central portion. The gland is essentially composed of numerous minute tubes, which are straight in the outer and convoluted in the central part. The tubes are lined with cells, and the cells separate the urine from the blood brought to the kidney, the urine passing in drops into the pelvis or cavity of the organ, and thence through the ureter into the bladder.

2. Sort; kind; character; disposition; tem-[Humorous.]

There are millions in the world of this man's kidney.

Sir R. L'Estrange.

This sense probably arose from the fact that the kidneys with the fat surrounding them are left exposed in slaughtered animals when they are cut up, and thus they furnish an easy test of the condition of the animal in respect of fatness. The literal applica-tion may attach to the word as put into Falstaff's mouth in the following extract.

'Think of that,—a man of my kidney,—think of that; that am as subject to heat as butter; a man of continual dissolution and thaw; it was a miracle to 'scape suffocation.'

orders of knighthood are of two classes—either they are associations or fratemities, possessing property and rights of their own as independent bodies, or they are merely honorary associations established by sovereigns within their respective dominions. To the former class belonged the three celebrated religious orders founded during the Crusades—Templars, Hospitallers, and Teutonic Knights. The other class, consisting of orders merely titular, embraces most of the existing European orders, such as the order of the Golden Fleece, the order of the Holy Ghost. The British orders are the order of the Garter, the Thistle, St. Patrick, the Bath, St. Michael and St. George, the Indian Empire, the Star of India, and the Royal Victorian Order. The orders have their appropriate insignia, which generally include a badge or jewel, a collar, a ribbon of a certain colour, and a star. We here give the insignia of the order of St. Patrick, an order instituted for Ireland in 1783. Elchi (el'chē). See Eltothi in Supp.

Elder, n. [add.]—Elder hand, in card-playing, the player who leads.

Electric, a. [add.]—Elderric lamp, the contrivance in which the electric light is produced. See Electric light below.—Electric light, a brilliant light, the result of heat produced by the force of electricity either evoked by the chemical reaction of a metal and an acid, or generated by a magnetoand an acid, or generated by a magneto-electric or other machine. The arc light is produced when two carbon pencils are attached to the electrodes of a powerful magtached to the electrodes of a powerful mag-neto-electric machine or galvanic battery, and their points are brought together long enough to establish the electric current. If they are then separated to a small distance, varying according to the strength of the current, the current will continue to flow, leaping across from carbon to carbon, emit-ting a light of great intensity at the space leaping across from carbon to carbon, emitting a light of great intensity at the space between the points. The name Voltaic or electric are is given to that portion where the current leaps across from point to point, the term are being suggested by the curved form which the current here takes. The incandescence, by means of electricity, of various substances, including carbon, in a vacuum. Many forms of apparatus are in use for producing the electric light, distinguished either by the form of the generating machine, the distribution of the current, or the kind of burner. In the Jablochkoff light, the burner consists of

the ourner consists of a pair of carbon spin-dles placed parallel to one another, with an insulating earthy sub-stance between them. Its combustion may be roughly compared to that of an ordin-ary candle, where the earthy substance takes the place of the wick. Other forms of the 'candle' burner are in candle burner are in use, such as the Lontin, the Jamin, &c. The Maxim, Edison, and Swan lights proceed from an incandescent flament of carbon in

a more or less perfect vacuum.—Electricma-chine. [add.] Besides machines in which electricity is excited by friction, electric maelectricity is excited by friction, electric machines are now common in which an electric current is generated by the revolution near the poles of a magnet or magnets of one or more soft-iron cores surrounded by coils of wire, those machines being known distinctively as magneto-electric machines. Adynamo-electric machine is a machine of this kind, in which the induced currents are made to circulate round the soft-iron magnet which produced them, thus increasing its magnetization. This again produces a proportionate increase in the induced currents, and thus by a successive alternation of mutual actions very intense magnetizaor mutual accions very meense magnetiza-tion and very powerful currents are speedily-obtained. There are many forms of these ma-chines, such as Gramme's, Siemens', Wilde's, Brush's, &c., used extensively in electric lighting, and as a motor for machinery, elec-

tric railways, &c.—Electric organ, an organ in which electricity is employed in connec-tion with the mechanism, one advantage of this being that the instrumentand the player may be a considerable distance apart, each where it is most convenient.—Electric pendulum, a form of electroscope consisting a pith-ball suspended by a non-conducting thread.—Electric railway, a railway on which electricity is the motor. Only short lines have as yet been constructed. On one of these the wheels of the carriages are set in motion by a dynamo-electric machine ni motion by a dynamo-electric machine placed between them and below the floor. This machine is actuated by an electric current produced by another dynamo-electric machine, which is stationary and driven by a steam-engine. The current is conveyed by wires which may be laid underground or supported on poles. By another system a storage battery carried by the car itself sup-

storage nattery carried by the car itself supplies the driving power.

Electrocautery (ë-lek'trö-ka"tė-ri), n. In sury, cautery by means of a platinum wire heated by the passage of an electric current. Electrocute (ë-lek'trö-küt), v.t. pret. & pp. electrocuted; ppr. electrocuting. [From electro-, and the cute of execute.] To execute or nut to death lus means of electricity a or put to death by means of electricity, a methodof punishing criminals recently intro-duced in the U. States. The form *Electricute*

Electrocution (ê-lek'trô-kū"shon), n. The act of electrocuting; execution by means act of electrocuting; execution by mean of electricity. *Electricution* is also used. of electricity. Electroaution is also used. Electrodynamometer (e-lek' trō-di-namom''et-èr), n. An instrument for measuring the strength of electro-dynamic action. It consists essentially of a fixed coll and a movable coil, usually suspended in a bifilar manner, and furnished with a mirror, so that its motions about a vertical axis can be read off by means of a scale and telescope. Electrokinetic (ë-lek'trö-ki-net"ik), a. Of or pertaining to electrokinetics or electricity in motion.

Electrokinetics (ë-lek'trō-kī-net"iks), n. That branch of electricity which treats of

electric currents in motion.
Electrometry (ë-lek-trom'et-ri), n. That branch of the electric science which treats of the measurement of electricity.

of the measurement of electricity. Blectrotomic (ê-lek'trō-tom'ik), a. Of, pertaining to, or produced by electrotomicity. Blectrotomicity (ê-lek'trō-tom-isi'-ti), a. A peculiar alteration of the normal electric current of a nerve, produced by the passage of a galvanic current through it. Called also Electrotomizs (ê-lek'trō-ton-iz), v.t. To alter the normal electric current of, as a nerve. See Electrogromology.

See ELECTROTONICITY.

See ELECTROTONIOITY.
Ellegize (elf-ejiz), v.t. and i. pret. & pp. elegized; ppr. elegizing. To write or compose elegies; to celebrate or lament after the style of an elegy; to bewail.

I. . . perhaps should have elegized on for a page or two farther, when Harry, who has no idea of the dignity of grief, blundered in. H. Walpole.

Elementalism (el-ē-ment'al-izm), n. The theory which identifies the divinities of the ancients with the elemental powers; worship of the elemental powers of nature. Gladstone.

Giastone.

Elementator (el'ē-men-tā-tér), n. The writer of an elementary treatise or manual. Sat. Rev. [Rare.]

Elementoid (el-ē-ment'oid), a. [L. elementum, an element, and Gr. eidos, form.] Like an element; having the nature of a simple

- married kowens, dangher of hengist.

 Vulcan, Vulca'nus. The Roman deity who
 presided over fire and the working of
 metals, identified with the similar Greek
 deity Hephestus. He made thunderbotts
 for Jupiter, arms for gods and heroes, and
 many wonderful contrivances; and had
 forges in Olympus as well as under Etna,
 where the Cyclops were his workmen. He
 is always represented as lame.
- Wackles, the Misses and Mrs. The keepers of a 'ladies' seminary' in Dickens's Old Curiosity Shop.
- Wade, Miss. A handsome woman, whose prevailing feeling is hatred of everybody, in Dickens's Little Dorrit.
- Wadman, Widow. A buxom lady in Sterne's Tristram Shandy, whose wiles nearly captivate Uncle Toby.
- Wagg and Wenham(wen'am). Two sycophants and doers of dirty work for the Marquis of Steyne in Thackeray's Vanity Fair and Pendennis.
- Wamba. The hair-brained jester of Cedric the Saxon in Scott's Ivanhoe.

- Ward, Artemus. Assumed name of C. F. Browne, especially employed when writing in the character of an old showman.
- Wardle, Mr., and his family. Characters in Dickens's Pickwick Papers, living at Dingley Dell, where Mr. Pickwick and his friends are hospitably entertained.
- Mardour (war'dor), Sir Arthur. In Scott's Antiquary, a somewhat pompous baronet of antiquarian tastes, a friend of the Antiquary, with whom, however, he has a famous quarrel. His beautiful daughter Isabella is loved by the hero Lovel, who turns out to he the heir of the Earl of Glenallan.
- Warren, Widow. A character in Holcroft's Road to Ruin, a woman of forty, aping the young girl, and eager for a third husband.
- Warrington, George. In Thackeray's Pendennis a young man of good family, a barrister and writer for the press, whose prospects have been blasted by an unfornate early marriage—a great friend of Pendennis. Members of the same family, but of an earlier generation, give name to Thackeray's novel The Warringtons.
- Warwick, Guy, Earl of. See Guy.
- Waverley (wā/vēr-li). The first of Scott's great series of novels, to which it gives name. The hero is Edward Waverley, a

young English gentleman, and the scene is chiefly in Scotland during the rebellion of 1746. The characters include the Baron Bradwardine and his daughter Rose, Fergus and Flora Mac-Ivor, Prince Charles Edward himself, Davie Gellatley, &c:

Wayland, the Smith. A supernatural smith of English and Scandinavian mythology. See also SMITH (WAYLAND).

Wegg, Silas. In Dickens's Our Mutual Friend a wooden-legged man with a street stall, whom Mr. Boffin engages to read to him, and finds him to be an ungrateful old scoundrel. Good Mr. Boffin admires the way in which this ignorant pretender can 'drop into poetry', that is, repeat some scraps of hackneyed verse at times.

Weissnichtwo (vīs nēcht-vō). That is 'knownot-where', the place in which was situated the university of Professor Teufelsdröckh in Carlyle's Sartor Resartus.

Wellborn, Francis. A character in Massinger's New Way to Pay Old Debts, nephew of Sir Giles Overreach, who pays off his debts under the notion that he is to marry a rich dowager.

weller, Sam. The valet or personal attendant of Mr. Plokwick in Dickens's Pickwick Papers, a genuine Londoner, uneducated, ready-witted, full of humour, and devoted to his master's interests. His father, Tony Weller, is a fat old coachman ignorant of almost everything except what belongs to his business. Having married a widow (who kept the Marquis of Granby Inn, and was painfully religious), he held strong opinious about widows and their artfulness.

Wemmick, Mr. Clerk to the lawyer Mr. Jaggers in Dickens's Great Expectations. He lived with his old father in a little house which he had converted into a sort of miniature fortress.

Wenham. See WAGG.

Werther (vār'tēr). A young German student, the sickly sentimental hero of Goethe's Sorrows of Werther, who puts an end to himself because he vainly covets his neighbour's wife. Thackeray compresses the story into a few humorous verses more pithy than complimentary to the hero.

Western, Squire. A jolly, ignorant, coarse, hot-tempered, and intensely prejudiced English squire in Fielding's Tom Jones. His charming daughter Sophia is in love with and marries Tom Jones.

Westlock, John. In Dickens's Martin Chuzzlewit, a fine young man who studies architecture under Pecksniff, and marries Ruth Pinch.

DESCRIPTION OF THE PLATES.

DECORATIONS OF HONOUR.

DECORATIONS of honour in the widest sense are, of course, almost infinite in number and variety, but those that we have to deal with here are only the most important, namely, such as are conferred by sovereigns and governments upon persons who have rendered important public services, or are for some reason deemed worthy of receiving special marks of distinction, in virtue of which they become members of special orders, as they are called. Many of the orders rank as orders of knighthood, and those members belonging to them who receive the full status of knights, if the orders are British, become entitled to the prefix "Sir" before their names. Other orders, however, have no such privilege connected with them, but all have some distinctive badge or personal decoration which the members are entitled to wear, and of which in general they may be justifiably proud. The badge in many cases takes the form of some sort of ornamental star, which is attached to the wearer's dress by a ribbon of special colour and pattern, and in some cases there may be a special collar belonging to the order, as well as various other insignia. In giving some particulars regarding the decorations of honour exhibited in the plate we shall begin with those that are British.

THE UNITED KINGDOM.

Order of the Garter. - The "most noble Order of the Garter". as it is termed, ranks at the head of all the orders of knighthood-not only British, but European. It was founded by Edward III., probably in 1344. Why the garter was selected as the emblem of the order has never been explained, though there is a well-known tradition, in which too much faith need not be placed, professing to throw some light on this point. The king seems to have instituted it in honour of his successful military operations against France, and hence the colour of its emblem, the garter, was blue, the French royal colour. The ribbon of the order is also blue. St. George was partly intended to be honoured by the institution of the order, and hence it is also known as the Order of St. George, while this saint figures prominently in its insignia. These are described and figured in the article GARTER in the Dictionary, but the appearance of the collar and badge will be much better appreciated from the coloured illustration in the plate. The garter itself is of dark blue velvet, edged with gold, and bears the motto Honi soit qui mal y pense, "Shamed be he who thinks evil of it". It is worn on the left leg, below the knee, but the queen wears it on the left arm, above the elbow. The collar consists of twenty-six garters encircling red roses, these being connected by as many golden knots. The order consists nominally of the sovereign and twenty-five other members, but there are also additional or supernumerary members. Besides the sovereign and princes of the blood, the rulers of the chief European countries are members of this order. The other members are all English, Scottish, or Irish peers. K. G. are the initials for Knight of the Garter.

Order of the Thistle.—This specially Scottish order is also called the Order of St. Andrew, the patron saint of Scotland, in whose honour it was instituted, and who naturally figures in the insignia. The collar and badge of the order are shown in the plate, while the insignia are also figured and described under the article THISTLE in the Dictionary. On the badge, as will be seen, is the figure of the saint bearing the cross of the well-known form associated with his name. The collar

consists of thistles and sprigs of rue enamelled in their proper colours. The ribbon of the order is green. The motto is Nemo me impune lacessit, "No one assails me with impunity". The special designation of "most ancient" belongs to this order. A fabulous origin, dating back to the time of King Achaius, has been sometimes claimed for it, and with more probability it has been said to have been instituted by James V. in 1540, but 1687 is the real date of its origin. The ordinary members of the order consists of sixteen Scottish noblemen. K.T. are the initials for Knight of the Thistle.

Order of the Bath.-The "most honourable Order of the Bath" dates from 1399, when King Henry IV. made forty-six esquires knights of the order. It afterwards fell into abeyance, but was renewed by George I. in 1725, and has several times since been enlarged and modified. Why the bath was selected as a designation of the order is not very clear, though bathing seems to have been one of the ceremonies associated with the conferring of Knighthood in ancient times. It now consists of three classes of members, those of each class being partly military (or naval), partly civil. The first class comprises Knights Grand Cross (G. C.B.), the second class Knights Commanders (K.C.B.), and the third class Companions of the Bath (C.B.). The members of the first two classes are of course entitled to the title "Sir", but those of the third class take no such designation. Officers of the military sections of the order must have attained a certain rank in the army or navy before they are admitted. The third class has by far the largest number of members, namely, 720 military, and 250 civil. The ribbon of the order is red; the motto is Tria juncta in uno, "Three joined in one", alluding to the three kingdoms, England, Scotland, and Ireland. The insignia differ somewhat according to the position of the possessor in the order, but the emblems properly belonging to it are the three imperial crowns and the rose, thistle, and shamrock. The plate shows the badge and collar belonging to a G.C.B. or K.C.B. of the order. The badge is an eight-pointed cross of gold and white enamel, with "a lion of England" (see description of plate of NATIONAL COATS OF ARMS) in each of the four angles; in the centre the rose, thistle, and shamrock, issuing from a sceptre between three imperial crowns; round this a red circle with the motto and a wreath of laurel issuing from a blue scroll bearing the words Ich dien ("I serve"-the motto of the Prince of Wales) in gold letters.

Order of St. Patrick .- The "most illustrious Order of St. Patrick" is, as its name implies, a specially Irish order. It was founded in 1783, and consists of twenty-one ordinary knights (Irish noblemen), besides the sovereign and royal princes. The collar is of gold, and consists of alternate harps, knots, and roses, there being a royal crown in place of one of the roses, to which is appended the badge by means of another harp. The badge is of gold, and oval in shape, round the outside being a ring of shamrocks, inside this a ring of blue enamel bearing the motto Quis separabit? (who shall separate?) and the date; while the centre is occupied by the red saltire or cross of St. Patrick, surmounted by a shamrock bearing gold crowns on its three leaves. The star of the order has eight silver rays, four of them larger than the others, the centre being similar to that of the badge inside the shamrocks, but circular in form. The ribbon of the order is sky-blue. K.P. are the initials for Knights of St. Patrick.

Order of St. Michael and St. George. - The "most distin-

α

guished order of St. Michael and St. George" was founded in 1818 by George IV. when regent, mainly for natives of the Ionian islands and of Malta; but after the Ionian islands ceased to be under British protection the order was extended and placed on a new basis, and it is now conferred on those who have held high and confidential offices within Her Majesty's colonial possessions, and in reward for services rendered to the crown in relation to the foreign affairs of the empire. The members are divided into Knights Grand Cross (G.C.M.G.), Knights Commanders (K.C.M.G.), and Companions (C.M.G.). Members of the first two classes are entitled to the prefix "Sir" to their names. The badge bears on one side (the obverse) the figure of St. Michael triumphing over Satan, on the other the figure of St. George and the dragon, with the motto Auspicium melioris œvi, "an auspice of a better time". The letters S.G. and S.M. form part of the collar—the initials of the two saints' names. Lions and white enamelled Maltese crosses also occur alternately. The ribbon of the order is blue, with a scarlet stripe.

Order of the Star of India.—The "most exalted Order of the Star of India" was founded in 1861 for the purpose of rewarding services rendered to the Indian Empire. It was subsequently enlarged, and consists of three classes: Knights Grand Commanders (G.C.S.I.), Knights Commanders (K.C.S.I.), and Companions (C.S.I.). The order ranks above that of St. Michael and St. George. "The badge consists of an oval cameo in onyx of the Sovereign, surmounted by a star of diamonds, and surrounded by the motto Heaven's light our guide. The gold collar consists of alternate red and white roses, the Indian lotus, and palm branches tied together in enamel. The star, five-pointed, is of diamonds, on a light-blue enamelled circle with the motto; rays of gold surround the whole. The ribbon is sky-blue, with a narrow stripe of white near the edge."

Order of the Crown of India.—The "imperial Order of the Crown of India" was instituted in 1878, and is conferred on ladies more or less associated with the Indian Empire, including Indian princesses and princesses belonging to the British royal family. The badge exhibits the monogram V.R.I. (Victoria Regina Imperatrix, "Victoria Queen and Empress") in diamonds, pearls, and turquoises, within an oval border of pearls, and surmounted by a crown. The ribbon is light-blue watered, edged with white.

Distinguished Service Order.—This order was instituted in 1886, and is conferred on military and naval officers for distinguished services performed in war and recognized in public despatches. The badge is a cross of gold and white enamel, bearing on one side within a laurel wreath of green enamel an imperial crown of gold on a red enamelled ground, and on the other side, similarly placed, the letters V.R.I. (see above). The badge is worn on the left breast, suspended by a red ribbon, edged with blue.

Order of Victoria and Albert.—This order was instituted in 1862, and, like that of the Crown of India, is conferred on ladies only, the recipients being divided into four classes. The badge is came showing the heads of Queen Victoria and Prince Albert, surmounted by a crown. It is suspended by a ribbon of white moire.

Victoria Cross, or Order of Valour .- The decoration of the Victoria Cross was instituted in 1856, and is bestowed for "conspicuous bravery or devotion to the country in presence of the enemy". This is the sole condition on which it is bestowed, and in regard to the attainment of this highly-prized honour officers and men are on precisely the same footing. The cross is a Maltese cross of bronze, with the royal crest (a lion upon a royal crown) in the centre, and below this the words "For valour" on a scroll. It is worn on the left breast, being suspended by a red ribbon for the army, and a blue ribbon for the navy, with a bar or clasp attaching it to the ribbon. A person may have the cross awarded him oftener than once, in which case he receives an additional clasp. Every non-commissioned officer, warrant officer, petty officer, soldier, seaman, or marine obtaining the Victoria Cross receives a special pension of £10 a year, and an additional clasp carries with it an additional £5 a year.

Volunteer Officers' Decoration.—This was instituted in 1892, and is conferred on commissioned officers of twenty years' standing; but to make up the twenty years, half of any time during which the party may have served in the ranks is allowed to be added to his period of service as officer. The decoration consists of an oak wreath in silver, tied with gold, having in the centre the royal cipher (V.R.—Victoria Regina) and crown in gold. It is worn on the left breast, suspended from a green ribbon by a silver clasp ornamented with oak leaves. (This decoration is of course quite distinct from the volunteer long service medal intended for all volunteers who have completed twenty years' consecutive service.)

AUSTRIA.—The order here illustrated is that of Francis Joseph, founded by the Emperor Francis Joseph I. in 1849. The cross is of gold enamelled with red, and bears between the arms the Austrian double eagle in black enamel, with the initials F. J. in the centre.

BAVARIA.—The Order of St. Hubert, originally founded in 1444, was restored in 1708, and in 1800 was confirmed as the Order of the House of Bavaria. The motto of the order is In trav vast, "firm in faith".

BELGIUM.—The Order of Leopold, founded by King Leopold I. in 1832, and consisting of five classes of members. The cross is of gold and white enamel, its arms being connected with a wreath of oak and laurel. The motto is L'union fait la force, "Union produces strength".

DENMARK.—The Order of the Elephant dates from the fifteenth century, and the use of this somewhat peculiar emblem is explained by a legend of a Danish crusader who slew an elephant when fighting against the Saracens. The collar of the order is formed of elephants and towers (or castles) alternately.

FRANCE.—The only order now existing under the republican government of France is that of the Legion of Honour. It was founded by Napoleon I. in 1802, and consists of five classes, namely: chevaliers or ordinary members, officers, commanders, grand officers, and grand crosses. The Legion of Honour is both a civil and a military decoration, and the recipients are extremely numerous (over forty thousand), the members each receiving a yearly pension according to their rank in the body. The cross worn by the chevaliers is of silver and white enamel. The higher ranks have it of gold and white enamel. The female head in the centre is emblematic of the Republic.

GREECE.—The only Greek order is that shown on the plate—the Order of the Redeemer, founded by King Otto I. in 1833. There are five classes of members, the lowest being known as Knights of the Silver Cross, because in their case the cross is of silver, while those higher in the order have it of gold. The cross bears a Greek motto which means, "Thy right hand has been glorified in might".

HUNGARY.—The royal Hungarian Order of St. Stephen was founded by Maria Theresa in 1764, and consists of three classes. Its badge is an eight-pointed gold cross, enamelled with green, and surmounted by the gold crown of St. Stephen. In the centre of the cross on a red field is a patriarchal cross, and round this is the motto, Publicum meritorum premium,—"A public reward for services". The ribbon is red in the middle and green on the edges.

ITALY.—The chief Italian order, the Order of the Annunciation, was founded by Amadeus VI. of Savoy in 1362. Its badge or chief decoration is a gold medallion, on which is a representation of the annunciation surrounded by love-knots, this being suspended from a collar of knots and roses.

ST. JOHN OF JERUSALEM.—The once famous and powerful Order of the Knights of St. John of Jerusalem or of Malta that formerly owned immense possessions throughout Christendom, has now dwindled away to a mere remnant. The Grand Master has had his quarters at Rome since 1834, and in England and some other countries besides Italy there

are a few representatives of the order. The cross of the order is of the well-known *Maltese* form, enamelled white and edged with gold, surmounted by a crown and trophy, and is suspended from a black ribbon round the neck.

NETHERLANDS.—The Netherlands Order of King William was instituted by William I. in 1815, and is bestowed as a reward for military services. The decoration consists of an eight-pointed gold white-enamelled cross, with a gold ball at each point, and between the arms, the Burgundian cross of laurel sprigs. Above it is a crown, by which it is attached to a ribbon of orange edged with blue. The arms of the cross bear the Dutch words, Voor moed, beleid, trouw—"For courage, zeal, fidelity". In the centre of the cross is what is intended to represent a steel for striking fire.

NORWAY.—The Norwegian Order of St. Olaf was founded by King Oscar I. in 1847, and is bestowed as a reward for services rendered to king or country, art or science, the members being divided into five classes. The cross is of gold and white enamel, eight-pointed, with a ball at each point, has a crowned Anglo-Saxon O (for Olaf) in the angles of the arms, and in the centre on a red ground, the lion of Norway surrounded by a blue ring. The ribbon is red with blue and white borders.

PONTIFICAL ORDERS.-The Order of Christ was founded as a Portuguese order in 1317, and when it was confirmed by Pope John XXII., in 1332, the Pontiff retained the right to nominate knights. The cross, as may be seen, is of a simple form, and is suspended from a red ribbon round the neck or attached to a button-hole. The decoration is bestowed for either civil or military services. The Order of the Holy Semilclare was founded by Pope Alexander VI. (Borgia) in 1496, with the object of encouraging pilgrimages to the sacred spot. The cross is a so-called Jerusalem cross of gold and red enamel, surmounted by a gold crown, and having in the angles four similar crosses—the five together being said to symbolize the five wounds of Christ. The ribbon is black. The Order of St. Gregory the Great was founded by Pope Gregory XVI, in 1831, as a means of recognizing zeal in defence of the faith, but is now awarded for merit of any kind. The cross is in the same form as several others shown on the

PRUSSIA.—The Order of the Black Eagle, the highest Prussian order, was founded by Frederick I. in 1701. It numbers thirty ordinary knights, and the bestowal of this order confers on the recipient hereditary nobility. The cross is of the Maltese form, made of gold and blue enamel, having black eagles between the arms, and in the centre in gold, the monogram F. R.—Fridericus Rex. The Order of the Iron Cross was founded by Frederick William III. in 1813, as a reward for distinguished services rendered in the war against the French. The decoration consists of a broad-armed iron cross mounted with silver, and having three oak leaves in the

centre. The crosses bestowed on account of the war of 1813-15 bear the initials F. W. with crown above, and the date 1813 below; those won in the Franco-German war of 1870-71 the initial W. and the date 1870. The decoration is not now confined to Prussians. There are three classes—grand crosses, and crosses of the first and second class.

RUSSIA.—The highest Russian order is that of St. Andrew, founded by Peter the Great in 1698, to reward distinction gained in the war against the Turks. The decoration consists of a double-headed eagle with outspread wings, black-enamelled gold, and overlying this a St. Andrew's cross of gold and blue enamel bearing a figure of the saint, and the letters S. A. P. R.—Scarctus Andrews, patronus Russiae, "Saint Andrew patron of Russia". The ribbon of the order is blue.

SPAIN.—The Order of the Golden Fleece is an Austrian as well as a Spanish order of knighthood. It was founded by Philip the Good, Duke of Burgundy, in 1429, in honour of the Redeemer, the Virgin Mary, and St. Andrew, and as a means of promoting religion and morality. Why the special designation was adopted for it is not very clear, but the characteristic emblem of the order is a sheep's skin suspended round the middle, and with the head and feet hanging down on either side. This is attached to what is described as a blue-enamelled fint-stone emitting flames, and fanciful decorations connect this with the red ribbon of the order.

SWEDEN.—The Order of the Seraphim is the highest and oldest of the Swedish orders. It is said to have been founded in 1260, and was renewed by Frederick I. in 1748. It is bestowed only on the highest dignitaries of Sweden, and on foreign princes and statesmen, and consists of only one class. The chief decoration is a cross of the eight-pointed or Maltese type with heads of cherubim between the arms, and in the centre, on a blue ground, three crowns and the letters I.H.S.—Jesus hominum Salvator,—"Jesus Saviour of men". This cross is suspended by a crown from the blue ribbon of the order.

TURKEY.—The Medjidieh or Order of Medjid was founded by the Sultan Abdul Medjid, in 1852. It is divided into five classes, the fifth and lowest of which numbers 6000 members. The decoration of the order represents a sun with seven groups of out-streaming rays, the groups being separated by small stars and crescents. In the centre is the cipher of the Sultan with the motto, in Turkish, around it,—"Zeal, honour, loyalty". Several French and English officers received this decoration after the Crimean War, and it has been bestowed upon various foreigners since.

WURTEMBERG.—The Order of the Crown of Wurtemberg has as its badge an eight-pointed white-enamelled gold cross with lions in gold between the arms, and in the centre the initial F. (for Friedrich) surrounded by the motto,—Furchtlos und trew, "fearless and true", on a red circle.

ETHNOLOGY.

TYPICAL EXAMPLES OF THE PRINCIPAL RACES OF MANKIND.

ETHNOLOGY is a branch of the wider science of anthropology. It is sometimes used as synonymous with ethnography, but the latter, properly speaking, has a more limited scope, dealing mainly with the external features by which the various races of men are distinguished, while ethnology takes note both of the physical characteristics of the races of man, and also of their intellectual and moral peculiarities, their manners and customs, the peculiar features of their languages, their political or social organization, their origin, relationship and distribution, &c. In classifying the races of man the chief physical characters that have to be observed are the shape of the skull and form of the features, the proportions of the limbs, the colour of the skin, and the colour and nature of the

hair. As these characters exhibit various gradations, and may be more or less pronounced, it is not always easy to draw a strict limit between two races, and various classifications of mankind have been proposed. The classification here followed is that given by Oscar Peschel, the descriptions also being mainly taken from his work on the Races of Man. The most important types will be found illustrated in the accompanying plates.

I. THE AUSTRALIANS.

These comprise the inhabitants of the continent of Australia, of the islands on the coast, and of Tasmania—the latter now extinct. The skull of this race is of the dolichocephalic

type, the jaws being also prognathous or protruded. The nose is narrow at the root, widening greatly below. mouth is wide and unshapely. The body is thickly covered with hair; the hair is black, elliptical in section, that on the head being frizzly, and standing out so as to form a shaggy crown. The colour of the skin is dark as a rule, sometimes black, though a light copper red also occurs. The Australians, on the whole, are in a very rude and degraded condition. Agriculture in any form is unknown among them; they have no permanent dwellings, but merely hastily constructed temporary shelters; their implements and weapons are few and inartistic, among the latter being the very remarkable boomerang; clothes they hardly wear, except a kind of cloak as a protection against bad weather; their food consists of roots, fruits, fish, and the produce of the chase, and they do not despise such eatables as caterpillars, lizards, ants, and worms. As a man must not marry a woman of the same tribe, the custom of wife-stealing is prevalent. Their language is much more complicated than that of many highly civilized races, being very rich in inflections.

II. THE PAPUANS.

This race, which is the one most closely allied to the Australians, occupies New Guinea, the Pelew Islands, New Caledonia, the Solomon Islands, New Hebrides, the Fiji Islands, &c., there being in some of those islands also an intermixture of Polynesians. The most distinctive mark of this race is their peculiarly flattened, abundant, and long hair, growing in tufts, and forming a prominent spreading crown round the head, sticking out as much as eight inches. The skin is always dark, being almost black in New Caledonia, brown or chocolate colour in New Guinea, blue-black in Fiji. The skull is high and narrow (dolichocephalic); the jaws prognathous; the lips fleshy and somewhat swollen; the nose hooked somewhat after the Jewish type. Both intellectually and morally the Papuans have attained a fair standard, and display considerable artistic and inventive power. Complete nudity is rare, both men and women having usually some sort of covering round the loins. They practise agriculture to some extent, having fenced fields and gardens. Among their religious ideas is included belief in a future state. The greatest blot on their character is the practise of cannibalism. As regards civilization the Fijians are the most advanced.

III. THE MONGOLOID NATIONS.

To this race belong the Polynesians and Asiatic Malays, the people of South-eastern and Eastern Asia, the Tibetese, some of the Himalayan tribes, all the Northern Asiatics, with their kinsmen in Northern Europe, and lastly the aboriginal population of America. The common characteristics of this widely spread race are: long straight hair, circular in section; almost complete absence of beard and body hair; skin dark-coloured, varying from leather-yellow to deep brown, sometimes inclining to red; prominent cheek-bones, and eyes in general set obliquely. The various members of the Mongoloid race may be classed under the following subdivisions.

1. The Malay race, comprising the Asiatic Malays and the Polynesian or Pacific Malays. The former include, besides the Malays of the peninsula of Malacca, of Sumatra, the Sunda Islands, Java, &c., also the Dyaks of Borneo, the Battas of Sumatra, the Tagals and Bisayas of the Philippines, the Macassars and Bugis of Celebes, and lastly the inhabitants of Madagascar. The Polynesians include the New Zealanders, the natives of the Sandwich Islands, and those of the Marquesas, the Samoan group, the Friendly Islands, &c. No race belonging to the Malay stock has a black skin; that of the Asiatic Malays is of a dirty yellow hue; among the latter obliquity of the eyes is common. The Asiatio Malays are said to be taciturn, cruel, and revengeful, but dignified and polished in manners. They have long since adopted Islamism. As regards natural abilities Wallace rates the Malays below the Papuans.

2. Southern Asiatics with monosyllabic languages.—This group comprises the Chinese, Indo-Chinese (Burmese, Siamese, Anamese, &c.), Tibetese, &c. They have all straight black hair, little beard or body hair, usually a yellow skin and oblique eyes. As is well known, a great portion of this family have attained a high degree of civilization, and are highly distinguished for inventiveness.

3. Coreans and Japanese.—These nations might be classed with the previous group, yet they display some well-marked peculiarities and their languages are considerably different in structure. The Japanese received their civilization from the Chinese, but have made many advances themselves; and, very different from the Chinese, they have shown themselves ready to adopt what is valuable in European civilization.

4. Northern Mongoloids of the Old World.—These comprise the Tungus, true Mongols, Turks, Finns, and Samoieds, all

the Tungus, true Mongols, Turks, Finns, and Samoieds, all much resembling the Chinese and Indo-Chinese group in physical characters, but living generally by hunting, fishing, and cattle-breeding. To the Tungus belong the Manchoos, who conquered China and established a dynasty there. The Mongols (or Tartars) include the Kalmucks, Buriats, &c. Among the Turks are classed Uigurs, Usbecks, Osmanlis, Turcomans, Yakuts, Nogaians, Kirghiz, &c. The Osmanlis are the Turks of European Turkey. The Finns comprise, besides the true Finns and the Lapps of Northern Europe, the Magyars or Hungarians, and the Bulgarians. The Samoieds are nearly allied to the Finns.

5. Northern Nations of doubtful position.—The Yenisei Ostiaks, the Ainos of Yesso, the inhabitants of Saghalien, &c. The Yenisei Ostiaks form a small tribe on the Upper Yenisei, and are quite distinct from the Ostiaks on the Ob. The Ainos are the oldest inhabitants of the Japanese islands. They are remarkable for their general hairiness, especially in the midst of smooth-skinned races, though they do not exceed Europeans in this respect.

6. The Behring's Nations.—These are North Asiatic and American tribes, which for the most part inhabit the shores of Behring's Straits, or have migrated from that region. The Esquimaux, or Eskimo, are the most important. They have oblique eyes, and broad, flat faces, and are of rather a low stature; their intelligence is decidedly good.

7. The American Aborigines.—There can be little doubt that the original inhabitants of America crossed over from Asia, and the Mongolian features are clearly marked among the natives of various parts of America, although generally the nose is more prominent and the face less flat. The colour varies, a reddish copper colour being very prevalent. The great bulk of the American aborigines may be classed as hunting tribes. In North America they are now sadly diminished in numbers; among them we many mention the Sioux (to which belong the Assineboins) and the Apaches. The Caribs live in Central America, and in the north of S. America The Guarani (Gourani) are scattered over a great part of South America. At the time of the Spanish conquest American civilization had reached a high pitch in Mexico and Peru.

IV. THE DRAVIDIANS OR ABORIGINES OF INDIA.

These tribes have the skin generally very dark, frequently quite black; their hair is long and black, not straight but crimped or curly; the hair of beard and body grows profusely; the lips are thick and fleshy, somewhat like those of the negroes, but the jaws are never prominent. The Dravidians comprise the Tamils, Telugus, Gonds, Santals or Southals, &c.

V. THE HOTTENTOTS AND BUSHMEN.

These are tribes of little importance inhabiting South Africa. They have the hair tufted and matted, the beard scanty, the body almost hairless; the jaws are moderately prominent; the cheeks project laterally; the lips are full, but not so much so as with the negroes; the nasal bones project little at the root of the nose, which is of the snub shape; the

opening of the eyes is narrow but not oblique. They are slimly built, and the Bushmen in particular low in stature. Their colour is yellowish or yellowish brown. The language of the two peoples, different otherwise, is characterized by various peculiar clicking sounds, produced by applying the tongue to the teeth. They have always been engaged in cattle-breeding; were acquainted with the smelting of iron and working in metal before the advent of Europeans; were sandals, leathern aprons, and cloaks; and for hunting carried bows with poisoned arrows. They are by no means devoid of intelligence, but their social development has been probably prevented by the dearth of water in South Africa.

VI. THE NEGROES.

The negroes inhabit Africa from the southern margin of the Sahara to the territory of the Hottentots and Bushmen, and from the Atlantic to the Indian Ocean. The negro races display great variety in external characteristics, and what is popularly considered the typical negro is rarely met with. The colour of the skin passes through every gradation, from ebony black to dark brown, copper red, olive, or yellow. In some tribes the nose is straight, in others hooked, though often broad and flat. The hair of the head is generally short, elliptic in section, and much crimped; that on the body is not plentiful; whiskers are comparatively rare. The negroes may be divided into the Bantu negroes and the Soudan negroes, these divisions being based on differences in language. Among the first, who occupy a great part of S. Africa, the best known are the Suaheli in the Zanzibar region, the Kafirs of the southeast, and the Bechuanas farther inland. The Kafirs are well known as a brave, warlike, and intelligent race; they practise cattle-breeding and cultivate the soil to a small extent. It is in the Soudan region that the most typical members of the negro race are found. The Mandingoes cultivate the soil and carry on an active commerce; they have public schools, and the majority of them can read. They are Mohammedans. The Bambarras are allied to the Mandingoes, but as yet have hardly emerged from barbarism. The Yoloffs, tall and wellmade, with regular features, are among the finest of the negro races. The Ashantees are intelligent, skilled in making cotton cloths, sword-blades, and other articles, cruel and bloodthirsty. These Soudan races are black, with crisp woolly hair.

VII. THE MEDITERRANEAN NATIONS.

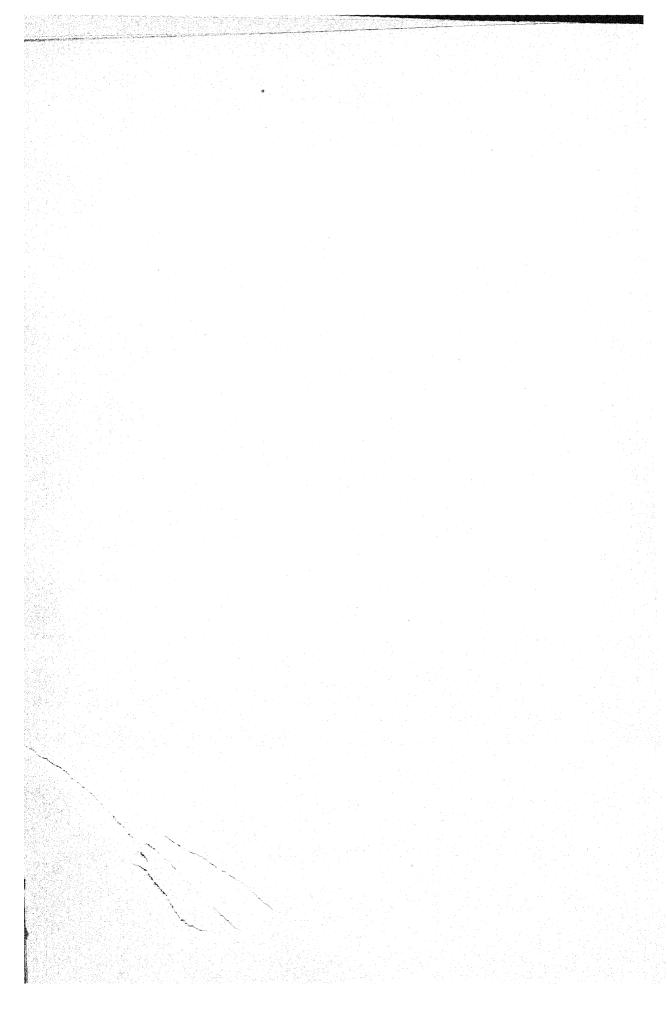

These include all Europeans who are not Mongoloids, the North Africans, all Western Asiatics, and the Hindoos. Among them are the highest members of the human race. The northern nations have the skin quite fair; the southern have it darker; in North Africa and Eastern Asia it becomes yellow, red, or brown. The nose has always a high bridge; prognathism and prominence of the jaws and cheek-bones are rare; the lips are never intumescent, and in no other race are refined and noble features so frequent.

1. The Hamiles.—This family occupies the whole of North Africa north of the Soudan and of East Africa to the equator. The Berbers are spread over a great part of this area, but in certain parts there has been a considerable intermixture of Arabs and other races. To this race belonged the ancient Egyptians, the modern representatives of whom are the Copts of Egypt and the Nubians. The Gallas live in the Abyssinian region. Their hair is long and curly; their features regular and agreeable, often European in east; their skin dark. They are a warlike, manly, and moral people. The Hamites were the first of the Mediterranean races to attain to a high state of civilization, their early history and achievements in this direction being made known to us from the ancient monuments of Egypt.

2. The Senites.—These comprise the Jews, Arabs, and Abyssinians, and the ancient Canaanites, Assyrians, Babylonians, and Pheenicians. They are more bearded than the Hamites, have high and generally aquiline noses, and well-marked eyebrows; skin varying from a rather dark shade to a deep brown. This race early attained a high pitch of civilization, and to them the nations of the West are deeply indebted.

3. The Indo-European or Aryan family, - This family is to us of paramount importance, as being that to which we ourselves belong. It has been divided from a remote period into two branches, a European and an Asiatic. The European comprises the Germanic or Teutonic nations (English, Germans, Dutch, Danes, Norwegians, Swedes, &c.), the Romance nations (French, Italians, Spaniards, Portuguese), the Slavonians (Russians, Bohemians, Servians, &c.), the Greeks, and lastly the Celts, now confined to Brittany, Wales, the Scotch Highlands, and Ireland. The Asiatic comprises the Hindoos, the Afghans, the Beloochs, the Persians, Armenians, and Kurds. The Indo-Europeans have the physical characteristics of the Mediterranean race in the fullest purity, while among the inhabitants of Europe the remarkable peculiarities of fair hair and blue eyes are frequent. The New World is now largely occupied by European Aryans, and probably the aboriginal races will in time entirely disappear. Among the Greeks, ancient and modern, the highest types of physical beauty are common. We meet with fair, ruddy and dark complexions, with golden, auburn, and dark hair, blue and dark eyes. The Spaniards, Italians, and natives of the south of Europe generally, have dark complexions, eyes, and hair, with frames less robust than the members of the Teutonic stock. The Germans were anciently described as tall, robust, with fair complexion, light or red hair, and blue eyes, and to some extent this description still holds good of the Germanic peoples. The physical characters of the Slavonians present little that is peculiar. The Russians, especially in the north, are fair, with light brown, flaxen, or red hair. The Persians, among Asiatic Aryans, are well known as a remarkably handsome people, with regular features, long oval faces, and large black eyes. The Mahrattas of Central India have proved themselves a warlike and vigorous race. Physically, they are said to be undersized, and not well formed.

4. Europeans of doubtful position.—These include the Basques of the north-east of Spain and south-west of France, and various tribes in the Caucasus. They are only set apart on account of their languages; in physical characters they undoubtedly belong to the Mediterranean race. The Basques are probably the oldest inhabitants of Europe. Among the races of the Caucasus may be mentioned the Georgians and Mingrelians.

DESCRIPTION OF THE PLATES.

ILLUMINATED WRITING.

ILLUMINATED writing is the name for writing in which ornamental letters in various colours are made use of, this writing being often embellished also with gold or silver, and small pictorial designs, arabesques, scroll-work, and the like. Writing of this kind has been known from a very early period, and in various countries. Colour was frequently used in ancient Egyptian writing, and the Romans seem also to have employed it to some extent. In the middle ages manuscripts were often ornamented in the most elaborate manner both in European and in Asiatic countries. After the invention and spread of printing the art of illumination was naturally practised to a very much smaller extent, but the use of colour for initials, &c., was adopted also in printed works, and is not even yet extinct, many books used in church service, for instance, having at least the rubrics (L. ruber, red) printed in red type. The earliest extant illuminated manuscripts produced in Europe belong to the fourth and fifth centuries after Christ, but works of this kind of such an early date are exceedingly rare. The oldest ornamented manuscripts in existence are a copy of Dioscorides at Vienna, and one of Virgil at the Vatican, both of the fourth century. The Virgil is written in capital letters, and is adorned with vignettes or miniatures. Another celebrated manuscript of early date, probably of the sixth century or earlier, is that known as the Codex argenteus (silver Codex), now in the university library of Upsala, containing Ulfilas's Gothic translation (or what remains of it) of the Scriptures, written in gold and silver letters on vellum stained of a purplish colour. In Ireland a special style of manuscript ornamentation early developed itself, among the chief features in which are the use of dots, generally in red, following the outline of the initials; the Z pattern; interlaced ribbons; fantastical animal forms curiously interlaced; delicate spiral lines; and tessellated patterns, or patterns made up of an infinity of little coloured squares. The most interesting specimens of this kind of work are the book of Kells at Dublin, and the Durham book in the British Museum, both containing the Latin version of the Gospels. The art flourished in Ireland from about the sixth century onward. From Ireland it was carried to Iona, and thence passed to the north of England. The Durham book was written at the priory of Lindisfarne, in the beginning of the eighth century, and the ornamentation is an admirable specimen of the illuminator's art. The book of Kells belongs to the ninth century, or, as others think, to the seventh. The Anglo-Celtic style of art had its influence on continental workmanship, as is seen in the illuminated manuscripts of the time of Charlemagne and Charles the Bald; while on the other hand continental models were imitated more or less in England, and the same manuscript may show both styles in combination. The work of the time of Charlemagne and Charles the Bald is more remarkable for splendour than originality, the ornamentation being exceedingly profuse, and gold being liberally employed. The initials often show patterns of classical origin mingled with intricate designs borrowed from the Irish school. The English illuminated manuscripts of the tenth and eleventh centuries, though owing much to foreign influence, are yet national in general character, and the initials and borders are especially remarkable for excellence in design, and for beauty and harmony in colouring. The next century shows greater strength VOL. II.

and originality. The twelfth century manuscripts are generally remarkable for the size and boldness of the writing, and the freedom and artistic character of the drawing. The initial letters are often on a gigantic scale, and display masses of conventional foliage, interspersed perhaps with animal figures, which appeared also in the initials of previous centuries. The English and French manuscripts of this period may be recognized by the delicate light blue and green colours employed in the initials. In the thirteenth century the Gothic character begins to take the place of the rounder letters of the preceding centuries. The initials, when they were not of the nature of miniature drawings, were "of various designs, highly painted in gold and colours, and generally having the interior spaces filled with interlaced and tortuous patterns, into which human figures and animals are introduced among conventional foliage. Simpler letters are coloured in red and blue in patterns apparently taken from sections of architectural mouldings, the interior spaces being filled with delicate lace-work drawn with the pen in red, violet, or other ink. In the next two centuries initials became stereotyped in their design, and were generally subordinate to the borders and miniatures" (E. Maunde Thompson). The greater number of extant illuminated manuscripts belong to the period between the years 1200 and 1500. In the earlier times they were scarce and costly, but latterly they became much more common, and works belonging to almost all departments of literature were adorned by the illuminator's art, including romances, chronicles, histories, &c., besides bibles, psalters, missals, and prayerbooks, or books of Hours (Horæ). Much valuable information is to be obtained from the pictorial illustrations adorning the pages of these works regarding the dress, furniture, utensils, arms, &c., of the period at which they were executed; since the illuminators had no hesitation in representing the personages of ancient history or legend in the garb and amid the surroundings of their own time.

The Latin alphabet was naturally that adopted by the nations of Western Europe, and the oldest manuscripts are written in capitals, two forms of which are recognized-the square and the rustic, the latter, as the name implies, being less carefully formed and somewhat rough in character, as suited to a more rapid style of writing. These were followed by what is known as the uncial style (see Uncial in Dict.), and that by the half- or semi-uncial, from which was developed the small or cursive hand. The continental modes of writing naturally passed over to England and Ireland. The earliest extant manuscripts written in Ireland are in half-uncials, similar to the characters met with in the manuscripts of Italy and France. The Book of Kells is written in this, and the Lindisfarne Gospels exhibit a smaller form of the same hand. This round hand was superseded in Ireland by a pointed hand which has survived in writing Irish up to the present time. In England the Roman uncials were imitated to some extent, but it was a modification of the Irish style that in Anglo-Saxon times became the national hand of England-first round, then pointed. This was superseded after the Conquest by the small or minuscule hand, which from the time of Charlemagne had become general in Western Europe, and from which the socalled black letter was developed, as used in the earliest printed books. Side by side with the book-hand there was also a succession of cursive hands in use for charters and other documents deemed less important than books.

VIIITH. CENTURY.—The alphabets here shown are collected from various sources belonging to this century.

XTH. CENTURY.—The capital letter is from a Bible once belonging to Charles the Bald of France, now in the British Museum. The alphabet is from a manuscript in the Museum.

XIITH. CENTURY.—Both initial and alphabet from a manuscript of 1190, in the British Museum.

XIIITH. CENTURY.—Reduced from a large missal executed mainly in this century, but completed early in the next. The words *Beatus vir*, &c., are the beginning of the Latin version of the first Psalm.

XIVTH. CENTURY.—From various examples of the period in the draughtsman's own sketch-books, the majority of them being copied from works in the British Museum.

XV_{TH.} CENTURY.—From reduced specimens from a fine MS. which belonged to the late Mr. Owen Jones, well-known as an authority on decorative art.

FISHES.

ILLUSTRATIONS OF TERMS USED IN ICHTHYOLOGY.

FISHES form the lowest of the five classes into which the great sub-kingdom VERTEBRATA is divided. They may be shortly described as vertebrate animals living in water and respiring the air therein contained by means of gills or branchiæ; having cold, red blood, and a heart consisting of one auricle and one ventricle; and having those organs which take the form of limbs in the higher vertebrata represented by fins. Their bodies are generally covered with scales overlapping each other like the slates on a roof, and their usual form (though with much diversity) is lengthened, compressed laterally, and tapering towards both extremities.

The scales of fishes assume various forms, which have been classed under the four types of cycloid, ctenoid, ganoid, and placoid. Cycloid scales are of a rounded form, and are those met with in the most familiar fishes. Ctenoid scales, like those of the perch, have spinous projections from their posterior margin. Ganoid scales are in the form of thick bony plates covered with a superficial layer of enamel. Placoid scales form detached masses of various forms often provided with spines. (See fig. 32.) In most fishes may be seen what is called the 'lateral line.' This consists of a row of scales extending along the side of the fish from head to tail, each pierced in the centre and communicating with a longitudinal canal. The purpose of this structure is not yet known for certain.

The skeleton varies greatly in character—from the lancelet that can hardly be said to possess a skeleton, to the well-developed osseous framework of the perch and many other fishes. Most fishes, however, can be classed as having either a cartilaginous or a bony skeleton. The vertebre are amphicaelous or biconcave, that is cup-shaped at either end; they vary in number from 17 to more than 200. (Figs. 28 and 29.)

The gills of fishes in their most common form consist of a great number of slender lamellæ, disposed like the teeth of a comb in parallel rows, and attached to bony arches on each side of the neck. They are richly supplied with blood-vessels, by means of which the blood that is driven to them by the heart, after circulating through the body, is purified through combination with the oxygen contained in the water, the water being constantly taken in at the mouth and made to pass over the gills. The blood after being aerated in the gills is driven again through the body without first returning to the heart.

The fins are called by different names according to their position. The pectoral fins, situated a little behind the head, correspond to the fore limbs of other vertebrata; the ventral fins, situated on the belly in front of the anal opening, correspond to the hind limbs; and there may be besides these, dorsal fins, attached to the back, and anal fins behind the anal opening. The pectoral and ventral fins when present are always each two in number; but both kinds may be absent. The tail or caudal fin is the chief organ of locomotion, and is

a broad vertical fin supported by the extremity of the vertebral column. In the most common form the tail is divided into two equal lobes, giving it a symmetrical appearance; this form is called homocercal. In many fishes, however, (as the sharks) the upper lobe of the tail is much larger than the lower, and the spinal column is prolonged into it. This form of tail is called heterocercal. (See fig. 31.)

The teeth of fishes are generally very numerous, and may be placed upon any part of the interior of the mouth, and even in the throat. (Fig. 30.) The stomach and intestines vary in form and dimensions. The stomach is usually large and welldefined. The intestine varies in length according to the food of the fish, being shortest in the carnivorous kinds. Its posterior extremity in many fishes has a peculiar spiral or screw-like structure. The liver is usually large, and the process of digestion is very rapid. The swimming bladder is a peculiar sac situated under the spine, filled with gas, and capable of being dilated or compressed, so as to enable the fish to rise or sink in the water. In some fishes it communicates by a duct with the cesophagus; in others there is no such communication; while in the flat-fishes, that live at the bottom of the sea, it is entirely wanting. Anatomically it is considered to represent a lung. (Fig. 27.)

Fishes propagate their species by eggs—though a few are ovoviviparous, i.e. retain the ova in their body till they are hatched. The ova are fertilized outside the body, and are usually in enormous numbers, as in the roe of the herring and cod. Among the elasmobranchs the number of ova is much smaller, and each ovum acquires before exclusion a horny sheath of various shape. The hatching process is generally left to take place without aid. A small number of fishes, however, construct nests.

The organs of smell consist of pits or sacs opening anteriorly, closed behind, with nervous filaments spread out on their walls. The sense of taste must be far from acute, and the same may be said of the sense of hearing. The apparatus of hearing has no external communication. The eye is generally of considerable size, and somewhat flattened externally. Special organs of touch are wanting in general, though some fishes, as the cod and mullet, have labial filaments or barbules to some extent serving this purpose. Among the most curious appliances with which fishes are provided are the electrical apparatus that appear in some species, as in the torpedo or electric ray and the electric eel, both of which possess batteries capable of giving a shock of considerable power.

Fishes may be divided into two sections—the Chondroptergations (from Gr. chondros, cartilage, and ptergation, a fin), or Cartilaginous fishes, having a cartilaginous or fibro-cartilaginous skeleton; and the Osseous or Bony fishes, having a bony skeleton. The following is the arrangement of fishes in orders, according to the system of Cuvier.

I. CARTILAGINOUS FISHES.

- Order I.—CHONDROPTERYGII WITH FIXED BRANCHLE, i.e. with the outer as well as the inner edge of the gills attached, and opening outwardly by several apertures. This order comprises such fishes as the Lampreys, the Sharks and Rays.
- Order II.—CHONDROPTERYGII WITH BRANCHLE FREE as in ordinary fishes, and like them with a single orifice furnished with an operculum or cover. To this order belong the Sturgeons and some other fishes.

II. OSSEOUS OR BONY FISHES.

The Osseous or Bony fishes, namely those having a firm and bony skeleton, and the gills free and protected by a bony gill-cover, are divided into six orders, as follows:

- Order III. PLECTOGNATHI, fishes that have the maxillary and pre-maxillary bones (which alone form the jaw) anchylosed or soldered together (whence the name from the Gr. pleklos, interwoven, and gnathos, jaw); bodies covered with ganoid scales, plates, or spines. Examples are, the Globe-fish or Sea Hedgehog, the Sun-fish, and the Trigger-fish.
- Order IV.—LOPHOBRANCHII (Gr. lophos, a crest or plume). Fishes that have the gills in little round tufts disposed in pairs on the branchial arches: they are covered with ganoid scales. Example, the Sea-Horse or Hippocampus, and the Pipe-fish.

The rest of the bony fishes are divided into two great groups, the *Malacopterygii*, and the *Acanthopterygii*. The fishes of the first group, which is divided into three orders, have the rays supporting the fins soft or many-jointed (except sometimes the first ray of the dorsal or pectoral fins), and are generally covered with cycloid scales. The fishes of the second group, which forms a single order, have spiny rays in their fins.

- Order V.—Malacopterygii Apodes. Fishes having a lengthened form; a skin soft and thick which scarcely suffers their scales to appear; no ventral fins (whence the name apodes, footless). Examples, the Common Eel, Electric Eel, Conger Eel, &c.
- Order VI.—MALACOPTERYGII SUB-BRACHIATI—Fishes having the ventral fins placed under the pectorals, and immediately attached to the bones of the shoulder. Examples, the Cod, Ling, Haddock, &c., the Sole, Turbot, Flounder and other flat-fishes.
- Order VII.—MALACOPTERYGII ABDOMINALES. Fishes having the ventral fins attached to the lower part of the abdomen and behind the pectorals. Examples, the greater number of our fresh-water fishes, besides many marine species; Salmon, Trout, Pike, Herring, Carp, &c.
- Order VIII.—Acanthopteryoii. Fishes that have the first portion of the dorsal fin, or the whole of the first dorsal when there are two—supported by spiny rays; sometimes instead of the first dorsal, they have nothing but a few spines; anal fin also with the first rays represented by spines, and generally one in each ventral fin: this order includes about three-fourths of all known fishes. Examples, the Perch, Wrasse, Mackerel, Mullet, Gurnard, &c.

Classifications differing in various respects from that of Cuvier are now commonly employed, though several of his divisions are still retained. The following orders (or subclasses) are usually recognized.

Order I.—Teleostei. Osseous or Bony Fishes, corresponding nearly to the Osseous fishes of Cuvier's classification.

Characters: Skeleton more or less thoroughly ossified; skull very complicated and composed of a number of distinct bones: two pairs of limbs usually present in the form of fins (the Malacopterygii having soft fin-rays, the Acanthopterygii, spinous rays); gills free, comb-like, or tufted; a bony gill-cover; usually cycloid or ctenoid scales.

Sub-order I.—Malacopteri. Fishes with a complete set of fins supported by rays, all of which are soft, with occasional and unimportant exceptions.

Fig. 2.—Flying-fish (Exocatus volitans); Atlantic Ocean. Pectoral fins of enormous size, so as to support the fish in taking long leaps out of the water.

Fig. 3.—Garfish, Sea-pike or Mackerel-guide (Belone vulgaris);
British seas.

Fig. 4.—Electric Eel (Gymnotus electricus); S. America; no ventral fins (apodous).

- Sub-order II.—Anacanthini. Fishes with fins entirely supported by soft rays; ventral fins wanting, or if present placed under the throat beneath or in advance of the pectoral fins.
- Fig. 5.—Cod (Gadus morrhua); ventral fins under pectorals; mouth with a barbule.
- Fig. 6.—Turbot (Rhombus maximus); one of the flat-fishes; body bordered by long dorsal and anal fins; bones of head twisted so as to bring both eyes on one side of body.
- Sub-order III.—Acanthopteri. Fishes having one or more of the first rays of the fins in the form of spines; scales usually ctenoid; ventral fins beneath or in front of the pectorals.
- Fig. 7.—Perch (Perca fluviatilis); Britain.
- Fig. 8.—Sapphirine gurnard (Trigla hirando); British seas. One of the Sclerogenidae or mailed-cheeks; head with plates and spines; pectoral fins large.
- Fig. 9.—Angler or Fishing-frog (Lophius piscatorius); British coasts. Pectoral fins, fleshy and supported on framework of bones; head with filaments which the animal waves as it lies in the mud, to attract the fishes on which it feeds.
- Fig. 10.—Remora (Echencis remora); Mediterranean. Head with sucking disk by which the animal can attach itself to objects.
- Fig. 11.—Sword-fish (Xiphias gladius); Mediterranean and Atlantic. Upper jaw prolonged, and forming a formidable weapon of attack.
- Fig. 12.—Sea-bat (*Platax Gaimardi*); Eastern seas. One of the Squamipennes or scale-finned fishes.
- Sub-order IV.—Plectognathi. Maxillary and premaxillary bones immovably connected; vertebral column often permanently cartilaginous; body covered with ganoid plates, scales or spines; ventral fins generally wanting.
- Fig. 13.—File-fish or Trigger-fish (Balistes conspicillum); tropical seas,
- Fig. 14.—Prickly Globe-fish or Sea-hedgehog (Diodon pilosus); tropical seas. Covered with spines, and body capable of being inflated like a ball.
- Fig. 15.—Short Sun-fish (Orthagoriscus mola); found in most sens.
- Sub-order V.—Lophobranchii. Gills in the form of little tufts upon the branchial arches; scales ganoid.
- Fig. 16.—Hippocampus or Sea-horse (Hippocampus guttu latus); Atlantic. Tail preheusile.
- Fig. 17.—Head and tail of Pipe-fish (Syngnathus viridis).

Order II.—Elasmobranchii. Cartilaginous fishes, as the sharks and rays.

Characters: Skeleton cartilaginous; no bones in the head, the skull forming a cartilaginous box; gills forming a series of pouches; two pairs of fins supported by cartilaginous finays; skin covered by placoid growths of various kinds, as tubercles, spines, &c.

- Sub-order I.—Holocephali. Jaws bony and covered with broad plates representing the teeth; only one external gill-aperture, covered with a gill cover; a powerful defensive spine on the back. The Chimera or king of the herrings is an example.
- Sub-order II.—Plagiostomi. Mouth transverse (Gr. plagios, athwart) and on the under surface of the head; branchial sacs opening by several distinct apertures. Sharks, rays, skate.
- Fig. 18.—White Shark (Carcharias vulgaris); the warmer seas.
- Fig. 19.—Large spotted Dog-fish (Scyllium catulus); British coasts.
- Fig. 19 a.—Sea-purse or Egg of Dog-fish, partially opened to show the young fish within.
- Fig. 20.—Head of Hammer-fish or Hammer-headed Shark (Zygæna malleus); tropical seas. The eyes are at the transverse extremities of the head.
- Fig. 21.—Head of Saw-fish (*Pristis antiquorum*); in most of the warmer seas. Snout prolonged into a flattened blade with tooth-like projections on either side. (See also fig. 29, which shows the skeleton of a ray.)

Order III. - GANOIDEI. Ganoid Fishes.

Characters: Body covered with ganoid plates, scales, or spines; skeleton partially ossified, the vertebral column being generally cartilaginous; skull with distinct cranial bones; usually two pairs of fins, the first rays of which are mostly in the form of spines; tail generally heterocercal.

There are few living ganoid fishes, the great majority of them being found fossil. The best known living examples are the sturgeons.

Fig. 22.—Sturgeon (Acipenser sturio); Caspian, Black Sea, and other European waters. Head and body protected by ganoid plates.

Order IV.—Marsipobranchii. Lampreys and Hag-fishes.

Characters: General form eel-like or serpentine; no paired fins to represent the limbs, only a median fin extending round the posterior extremity of the body; mouth circular and destitute of jaws proper; gills in the form of fixed pouches or sacs.

Fig. 23.—Sea Lamprey (*Petromyzon marinus*); British waters. Seven round holes on either side of the neck admitting water to the gills.

GEOLOGY.

ILLUSTRATIONS AND EXPLANATIONS OF TERMS USED IN GEOLOGY.

STRATA left in their original position are usually horizontal (fig. 1, a). Where they have been subsequently disturbed so as to be tilted more or less out of that original position, they are said to be inclined; the angle of inclination is called the dip, and the rocks are said to dip in the direction of greatest slope or declivity. In fig. 3. the dip is shown by the faces of the rock represented as inclined towards the observer's left hand. Imaginary lines running at right angles to the line of dip are lines of strike, and are represented by the line where the surface of the water cuts the faces inclined towards the observer. The strike of a stratum is always constant for a given dip; but the outcrop or line where the rock appears at the surface, varies in form and direction with the variation in the form of the surface itself.

Strata bent upwards into an arch form what is called an anticlinal (fig. 1, b), and a bend in the opposite direction gives rise to a synclinal (fig. 1, c). Strata suddenly bent from a horizontal to a vertical position, and then back to a horizontal position again without rising to the same level as before, are called uniclinal (fig. 1, d). Sometimes the synclinals and

anticlinals have been squeezed together so as to double the rocks up quite on end; such strata are described as vertical (fig. 1, e). Where the folding has taken place in such a manner as to lay the folds more or less on their sides, the strata lying face downward are said to be inverted (fig. 1, f). Contorted strata are such as have been crumpled into an irregular series of folds, too complicated to be separately distinguished (fig 1, g).

A fault is a plane of dislocation affecting rocks in such a way that a particular bed is broken off and slipped to a lower level on the one side of the plane than its counterpart on the other. (See fig. 2.) The side of the fault occupied by the lower of the two is called the downthrow, and the opposite side is sometimes spoken of as the upthrow. A fault is generally a narrow fissure extending downwards, either singly or in conjunction with other faults, to an indefinite depth from the surface; and extending in a horizontal direction to a distance dependent upon the amount of downthrow, and upon the nature of the dip affecting the rocks on either side of the fault. The throw of a fault is the amount of dislocation between the

termination of a bed on one side of the fault, and the corresponding point on the other. This may range from a dislocation scarcely perceptible to a throw of many thousands of feet.

Faults are usually inclined from the vertical more or less; the inclination is called the hade of the fault, which is said to hade in the direction of the slope. In an ordinary fault this hade, or inclination from the perpendicular, is forward at the foot in the direction of the downthrow, and no part of a faulted stratum is brought vertically beneath its counterpart on the other side of the fault. Where the fault hades in the opposite direction it is called a reversed fault (fig. 2, a).

Two or more faults frequently throw down towards each other, and their respective hades are such as to cause the faults to meet below the surface. Such faults are termed trough faults (fig. 2, b). Where the depression of the strata represents the aggregate effect of a series of minor faults, each in succession letting the rock down in the same direction to lower levels, the term step fault is found convenient (fig. 2, c).

The faces of the rock contiguous to a fault are frequently scored and fluted, and they exhibit other signs of grinding against each other under pressure. To these markings the term slickensides is applied.

The matter detached by friction and caught in the interspaces between the faces of the rock in a fault is usually cemented by infiltered mineral matter, and then constitutes a fault-breccia or rider.

Where faults, seen in plan, are shifted out of their course along the line of a fault transverse to them in direction, this last is called a *cross vein* or *caunter*, and the faults deranged are said to be *trailed*.

The same kind of dislocation seen in vertical section is distinguished as a heave. In this last case the dislocated fault is undoubtedly older than the fault that heaves it. In the former case it is the reverse.

The contact disturbance attending a fault gives rise to bending of the strata next the fault. This bending is often spoken of as the *burr*.

The name of joints (fig. 3) is applied to the divisional planes that cut in two or more directions across the bedding planes of hard rocks, and divide what would otherwise have been continuous sheets of stone into separate blocks. Jointing differs from cleavage in affecting the rock only along certain lines, instead of developing a general tendency to split into an indefinite number of sheets as cleavage does. Joints are developed in greatest prominence in thickly-bedded stratified rocks, especially in such as are of a compact nature. In such cases they may be observed to cut down through the rock in two or more directions approximately perpendicular to the planes of bedding. The horizontal extension of joints may range to every point of the compass, but there is a marked tendency, where more than two sets occur, for one of the more prominent sets (or master joints) to be intersected by another prominent set at such angles as to enclose blocks whose outlines vary from rhombic to rectangular. (See also fig. 9.)

The bearing, or orientation, of joints varies considerably in different places, and does not appear to be persistent for any great distance in any given district; but it is not uncommon to find one set ranging in a general way in the same direction as the dip, and another set bearing at right angles to these and therefore parallel with the strike. The first are celled dip joints, and the other strike joints. In the diagram (fig. 3.) the dip joints are shown cutting down vertically through the rock in a direction away from the observer; while the strike joints intersect the dip joints at right angles, and thus unite with the bedding planes to divide the rock up into rectangular blocks.

Strata are called *conformable* (fig. 4,) when they lie with an even junction on the original upper surface of one and the same bed of the rocks next below them, and are therefore affected to an equal extent by the same dips. In normal conformability the upper strata form part of one series with the beds immediately below them. In some other cases, while

the physical relation of the higher strata to the lower are of this nature in one locality, in another the lowest bed of the higher service may extend across, or overstep, several members of the series next below. In such a case the rocks are said to be locally or accidentally conformable.

Where a stratum has been deposited in unequal thickness in an area under notice, so that at one part it is found to thin away to nothing, the upper stratum extending beyond it is said to overlap the one that thins out, and the case is described as one of overlap. (See fig. 5.) Thus in the diagram b thins away in one direction so that a comes into direct contact with c below, and is said to overlap b. Tracing the physical relations of these in an opposite direction, or from d in the direction of a in the figure b, is said to underlap a. In overlap the absence of the bed that is overlapped arises from the fact that the stratum locally absent has never been deposited at that point at all: while in overstep, which is often confounded with overlap, and denotes the relation of a higher set of strata to a lower in the case of unconformity (fig. 6), the strata locally absent have been disturbed and afterwards removed by denudation.

Where a particular stratum known to form a bed of importance in one direction gradually dies away in another, as a result of unequal deposition, the stratum is said to thin out at the point where it comes to nothing (fig. 5). Another term of the same kind, which is often restricted to the attenuation of a bed of minor importance, is wedge-bedding.

Where the basement beds of one group of strata have been deposited over the edges of more than one member of the series below, as a consequence of the lower group having been consolidated, disturbed by upheaval, and partly denuded, before the deposition of the strata that now overlie them, the two sets are said to be unconformable to each other (fig. 6), and their physical relations to each other are denoted by the term unconformability or unconformity. Unconformity may range in extent from such cases as that of the Lower Eocene strata on the Chalk in the South of England, where the discordancy can be perceived only by an instructed eye, to such unconformities as that at the base of the Carboniferous rocks in the northern parts of the kingdom, where the gentlyinclined basement beds of the higher series are supported upon the upturned edges of the rocks below, so that the Carboniferous rocks overstep a thickness of over five miles of the pre-carboniferous rocks beneath (fig. 6).

Interbedded eruptive rocks (fig. 7) are accumulations of rock matter that have been primarily derived from deepseated sources, and that have been distributed over the surface in the neighbourhood of a volcano. The matter cast out from a volcano may consist of lavas (fig 7, a) or the liquefied rock that has flowed from the crater over the surface adjoining; or of the same materials as compose the lavas hurled forth in the form of various-sized fragments, and subsequently rained through the air and distributed over the surface. Mud poured out from volcanic vents also forms part of the matter ejected. The coarser volcanic materials of a fragmental nature form volcanic breccias or agglomerates when compacted into stone (fig. 7, b); while the like accumulations of finer materials are usually distinguished as tuffs. In maritime districts any or all of these forms of eruptive matter may be deposited alternately with beds of the ordinary sedimentary type, and the tuffs may graduate insensibly into other deposits in directions away from the vents. Interbedded eruptive rocks are known to occur of all ages, from the oldest Cambrian rocks of St. David's to the strata forming at the present day.

Intrusive eruptive rocks (fig. 8) differ from interbedded or contemporaneous eruptive rocks in their mode of occurrence in relation to the strata surrounding them; as they commonly out across the bedding of the stratified rocks, and are therefore of later date than the rocks they traverse. Intrusive eruptive rocks may occur in the form of great masses that from an unknown depth below the surface have, as molten matter, eaten their way upwards through the overlying rocks and have solidified in the form of a great mass (fig. 8, a). Or

the causes that gave rise to the formation of a mass in one case, may in another have impelled the molten matter in such a direction that it has eaten its way into the rocks along a direction frequently approaching that of the bedding, and thus have given rise to intrusive sheets (fig. 8, b). In other cases the same matter has been forced upwards along vertical fissures, and has been left in the form of wall-like masses of rock or dikes (fig. 8, c).

Cleavage (fig. 9) is the tendency to split into an indefinite number of thin layers in one direction, which direction is not necessarily connected with any original structural differences of the rock.

There are two recognized forms of cleavage; the one representing the tendency inherent in certain definite chemical compounds to fracture more readily in particular directions than in others, which directions always bear some definite geometrical relation to the particular crystalline structure of the mineral; while the other is developed only as the result of certain imperfectly understood special conditions, which have affected particular portions of large mineral aggregates more or less according to their texture rather than to their chemical composition. It is now customary to restrict the term slate to rocks of this description. The rocks most commonly affected by staty cleavage are such as originally consisted of clavey or argillaceous materials of sedimentary origin; but the same structure is not uncommonly met with in the finer portions of the older volcanic tuffs. A good example of this last is afforded by the cleaved volcanic tuffs or "green slates" of the English Lake District. The discrimination between planes of cleavage and the original bedding planes of the cleaved rock is often attended with great difficulty in the field, and can generally be satisfactorily determined only by the discovery of the stripe, or alternations of texture, resulting from original differences in the character of the various layers of material composing the rock. In the figure the stripe or original bedding is shown by the undulating bands parallel to the upper and the under surfaces, the triangular face cutting obliquely downwards across the front right-hand corner of the specimen represents a plane resulting from the cleavage. The edges of other cleavage planes are shown cutting across the stripe or bedding in directions parallel to the edges of the triangular face. The remaining bounding surfaces at the front, sides, and back are joints.

Conglomerate (fig. 10, A) is the name given to rock consisting of consolidated shingle. It is formed of an accumulation of rock-fragments of sedimentary origin, many of them of large size, and most of them well-rounded in form, bound together into a mass of a more or less stony nature by some cementing material instead of remaining in its original conglomerate consists of water-worn materials of volcanic origin it is distinguished as a volcanic conglomerate, or applomerate.

If the proportion of materials of a rounded form is less than that of such as are angular the rock then becomes a breccia (fig. 10, B). Breccia thus resembles a conglomerate in consisting of a noticeable proportion of large stones compacted into a mass, but is characterized by containing more angular constituents than rounded. Where the materials consist of angular fragments of rocks derived directly from a volcanic source the resulting rock is a volcanic breccia; finer materials of the same nature constitute a tuff. Both volcanic breccias and tuffs are often termed volcanic ashes. (See also fig. 7.) Where the rounded fragments outnumber the angular these rocks graduate into their respective conglomerates.

Oblique lamination (fig. 11) is a term usually applied to the deposition of the several layers composing a bed of rock at an angle different from the general lie of the rock as a whole. Where the inclined layers are of considerable thickness the rock is said to exhibit false-bedding, or current-bedding, the last-mentioned term denoting the cause. Oblique lamination and false-bedding generally result from irregular deposition of materials drifted along the bottom by variable currents of water; but a similar structure is often developed in great perfection where sand, or other materials of that

general nature, is drifted into beds by the action of the wind.

The name of inlier (fig. 12, A, and I in fig. 13) is given to an exposure of an older stratum at the surface in such a manner that it is completely surrounded by other strata of later date, which formerly extended across it, but have since been removed by irregular denudation. Occasionally the exposure of the older stratum is due to the combined effects of faults and denudation; in that case the older stratum exposed is termed a faulted inlier.

An outlier again (fig. 12, B, and also o in fig. 13) is an outstanding relic of a stratum, formerly more extensive, which has been isolated by the removal of the strata that once connected it with the principal mass, so that it now occurs as a detached remnant surrounded by rocks of older date.

Escarpment (fig. 13, E) is a term correctly restricted to the steep outer edge presented by such strata of a series as have better withstood the action of the destroying influences that have been brought to bear against them than the strata immediately above and below. An escarpment differs from a cliff in coinciding with the outcrop of a particular bed of rock. whether this is inclined or not, whereas a cliff is formed without regard to either the nature or the lie of the rock, and its base always approximates more or less closely to horizontality. Escarpments may be regarded as ranging on the whole parallel with the strike, and their steep side as facing in the opposite direction to the dip or direction of greatest inclination of the rock. The slope formed by the exposed upper portion of an inclined stratum, extending from the escarpment in the direction of the line where the next higher stratum comes on, is called the dip slope (fig. 13, D). (See also fig. 3.)

The names boulders and boulder clay (figs. 14, 15, 16) pertain to a promiseuous assemblage of stones of all sorts and sizes jumbled together without regard to either their size or their form in a matrix of clay which usually exhibits no very obvious signs of stratification. The stones include a variable percentage that are smoothed and are characterized by the occurrence of grooves and scratches, mostly running in the direction of the length of the stone, but sometimes crossing that line at various angles. The stones vary in size, from mere grains up to blocks many feet in diameter, and they may include representatives of rocks whose birthplace is known to lie at distances ranging from a few hundred yards to as many miles from their present resting-place. The larger stones that are smoothed and furrowed in this way are called glaciated boulders (fig. 14). Such boulders are usually found to have travelled outwards in a direction away from the centres of mountain groups; but more of them have travelled in directions from the Pole towards the equator than in other directions. It is not uncommon to find instances of boulders occurring at points considerably higher than any part of the parent rock.

The rock surface underlying boulder clay is frequently characterized by similar appearances to those presented by the boulders; that is to say, it is smoothed and more or less distinctly furrowed in one or more directions. Where this surface has a convex, knoll-shaped form, it is called a rocke moutonnée (fig. 15, A). Boulders carried by ice and left stranded in conspicuous positions are often spoken of as perched blocks (fig. 15, B).

The phenomena under notice are now generally admitted to be due to glacial action of some one or other kind; but the particular mode of operation resulting in any given effect has not yet been generally agreed upon.

The columnar structure of rock is exhibited in fig. 17. This is a form of jointing affecting certain rocks that have originated in a molten condition. The rock is intersected at right angles to the surfaces of cooling by three or more sets of divisional planes, which occur at approximately equal distances apart, and cross each other at such angles as to divide the rock into a series of prisms more or less regularly hexagonal in section. Columnar structure is developed in greatest perfection in basaltic lavas; but it often occurs,

though usually in a less perfect form, in eruptive rocks of other kinds.

Rocks often present a resicular structure (fig. 18) where lava flowing out from volcanic vents contains much entangled gas or vapour, and the molten rock is blown out at numerous points, so that cavities, cells, or resicles are formed. These occur in greatest number where the pressure is at the least, which is usually near the upper surface of each flow. Vesicular structure may range in extent from a few cells occurring at remote intervals throughout rock otherwise compact in texture, to rock like pumice, which consists of a light spongy mass of cell walls, like a mass of froth changed to stone

The vesicles in a lava are usually drawn out into almond-shaped cavities by the flow of the rock prior to complete solidification. Where these almond-shaped cavities become filled with other mineral matter the separate kernels are called amygdules, and the rock itself an amygduloid. Vesicular structure is sometimes found in intrusive rocks; and is occasionally developed also in rocks of purely sedimentary origin.

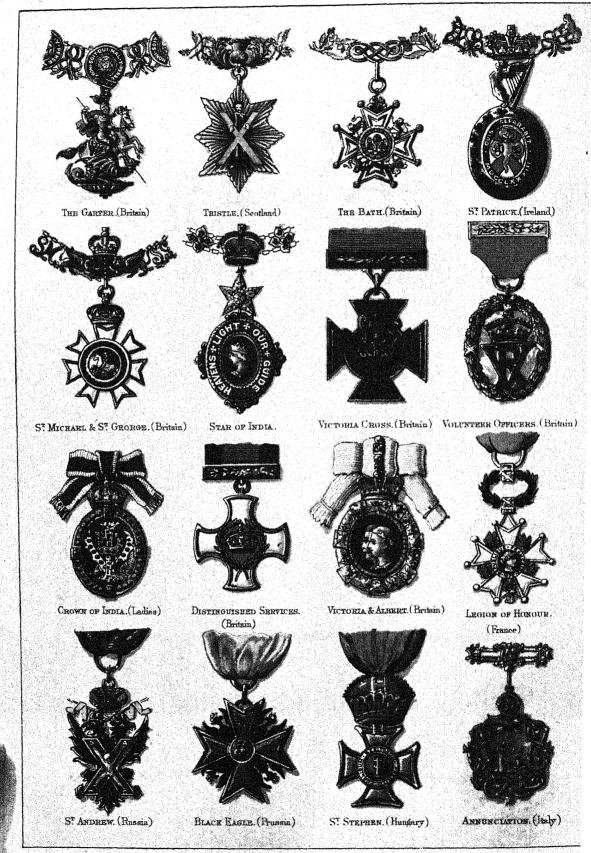

Cellular structure resembles vesicular structure in some respects, but is often due to the shrivelling up of the rock caused by a change of its dimensions in passing from one chemical state to another, as where ordinary limestone is altered into magnesian limestone or dolomite, and cells or geodes result from the general contraction of the rock. Another kind of cellular structure is due to the removal, by solution or otherwise, of part of the materials composing a fragmentary rock, such as a breccia, or a conglomerate, the spaces they occupied being left vacant.

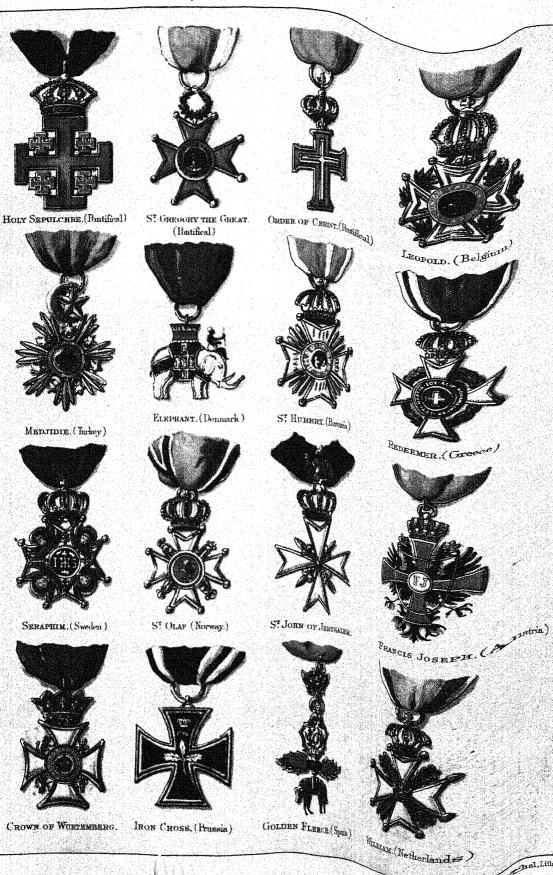

Foliation (fig. 19) is the re-arrangement of the constituents of a rock by metamorphic action in such a manner that they form parallel layers of definite mineral constitution. These layers are not necessarily connected with the original stratification of the rock, though their coincidence is common. As a rule foliation represents one of the stages of metamorphism whose extreme is occupied by granite. Amongst the rocks exhibiting foliation are mica schist and gneiss. In fig. 19, which represents a piece of gneiss, the lighter bands denote quartz and felspar, and the darker bands layers of mica.

Granite (fig. 20) is essentially a granular-crystalline eruptive rock formed and consolidated beneath the surface under conditions of great pressure. The minerals composing it consist of more or less well-defined crystals of orthoclase or potash felspar, with interspersed granules of quartz, and, in normal granites, with one or more species of mica; other species of felspar are also usually present as well. The separate constituents of granite may range from proportions only just discernable by the unaided eye, to crystals two inches or more in length. Where large crystals form a conspicuous feature in the rock it is termed a porphyritic granite. Granites occur of all ages, from the date of the oldest known rocks down to the Tertiary Period. Granites appear to represent the innermost parts of masses that were connected on the one hand with truly intrusive and volcanic rocks, and on the other with metamorphic rocks of sedimentary origin.

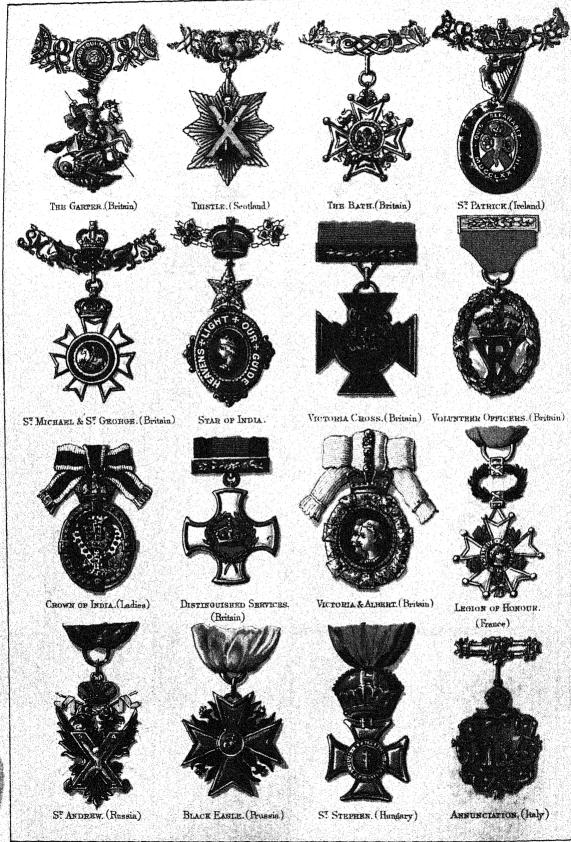

The spherulitic structure (fig. 21) is one of the principal types of minute structure rendered evident by a microscopic examination of thin slices of certain vitreous acid rocks (eruptive rocks containing more than 60 per cent of silica); notably in the glassy or vitreous lavas known as obsidian. It is occasionally developed in similarly constituted rocks of intrusive origin, or even in rocks whose present peculiarities of structure are largely due to the action of metamorphism. Under the microscope spherulitic rocks exhibit, in a base of variable mineral constitution, minute scattered granules of a more decidedly vitreous nature, which show an approximately circular outline more or less definite in proportion to the abruptness or otherwise of the transition from the spherulite into the matrix. The inner part of each spherulite usually presents a radiate structure, due to the incipient development of groups of minute crystals.

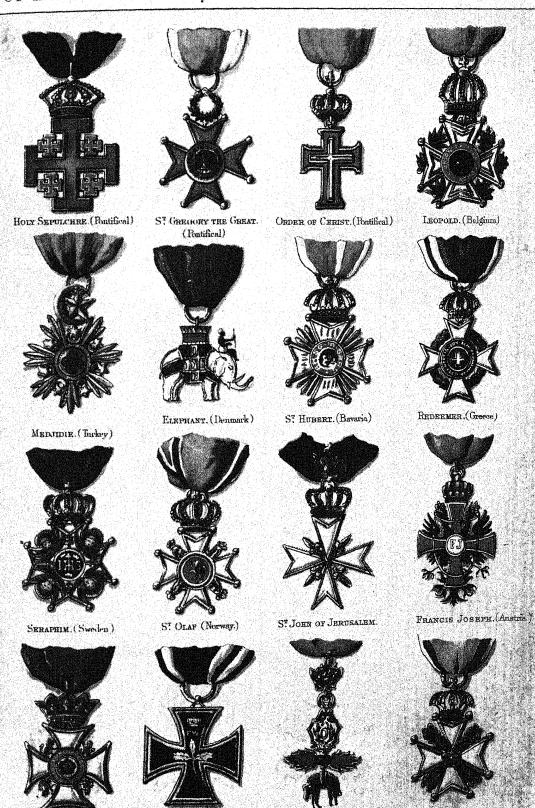

The perlitic structure (fig. 22) is due to a tendency developed in certain vitreous acidic rocks to fracture into minute concentric layers of a spheroidal form, in the interspaces between the minor shrinkage-fissures traversing the rock. On a large scale the same structure finds a parallel in the spheroidal structure developed in some basalts. Both structures are now generally regarded as being developed by the contraction of the rock consequent upon its solidification. (Rutley, Study of Rocks, p. 182.)
